Our primary care residency programs will have been reoriented to a new primary care model, with faculty adequately prepared to train new physicians on organized care delivery models that emphasize team-based practice, quality and cost control. The transition to this team-based, proactive healthcare delivery model will help to address many of the barriers that the low-income population typically encounter in getting the appropriate care, facilitating better health outcomes.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

It has been well-documented that our current system of care is fragmented, which leads to suboptimal performance, including unnecessary procedures, safety problems, avoidable complications and costs, and the available care can vary greatly in both quantity and quality (Swensen SJ, et al. Cottage Industry to Postindustrial Care — The Revolution in Health Care Delivery. February 4, 2010. N Engl J Med, 362(5);e12). In order to move closer to a well-functioning health care delivery system, providers must have training that prepares them for the coordinated, outcomes- and evidence-based health care systems they will be entering. A recent nation-wide study conducted with medical students found that students felt their training was appropriate in terms of clinical decision making and clinical care, but felt that their training had not prepared them appropriately for practicing medicine (Patel MS, Davis MM, Lypson ML. Medical Student Perceptions of Education in Health Care Systems. September, 2009. Academic Medicine, 84(9):1301-6).

Project Components:

Through the UT Health Regional Academy for Translational Medicine and UT Health Academy for Patient Quality and Safety Program, we propose to meet all required project components listed below.

1) UT Health will enlist/recruit faculty for the development of the new primary care residency program.
2) Faculty will be trained in the new primary care medical home model.
3) The new primary care training program will provide resident training on:
   a) medical homes,
   b) chronic care models,
   c) disease registry use for population health management,

d) patient panel management,
e) oral health, and
f) quality/performance improvement

4) UT Physicians clinics will serve as the continuity clinics for the new residenty program.

Milestones and Metrics:

For the UT Health Regional Academy for Translational Medicine and UT Health Academy for Patient Quality and Safety Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY3.

Process Milestones and Metrics:

Milestone 1 [P-8]: Establish/expand a faculty development program
Metric 1 [P-8.1]: Enrollment of faculty/staff into primary care education and training program
Milestone 2 [P-9]: Develop/disseminate clinical teaching tools for primary care or interdisciplinary clinics/sites
Metric 2 [P-9.1]: Clinical teaching tools

Improvement Milestones and Metrics:

Milestone 3 [I-14]: Increase the number of faculty staff completing educational courses
Metric 1 [I-14.1]: Number of staff completing courses
Milestone 4 [I-15]: Increase primary care training in Continuity Clinics, which may be in diverse, low-income, community-based settings, (must include at least one of the following metrics):
Metric 1 [I-15.1]: Increase number of Continuity Clinic sessions available for primary care trainees.

Unique community need identification numbers the project addresses:

This project addresses community needs CN.16 (Shortage of primary and specialty care physicians), CN.25 (Graduate medical education, residency training, in health care systems, team-based practice, quality improvement, and cost control), CN.7 (Insufficient access to care coordination practice management and integrated care treatment programs), and CN.24 (Lack of care coordination and unnecessary duplication of services due to insufficient implementation and use of electronic health records)

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This is a new initiative. The current residency program does not include training for residents on health care systems, patient-centered team-based practice, quality improvement, and cost control.

Related Category 3 Outcome Measure(s):

OD-14 Workforce Development

- IT − 14.6 Percent of trainees who have spent at least 5 years living in a health professional shortage area (HPSA) or medically underserved area (MUA)

- IT – 14.7 Percent of trainees who report that they plan to practice in HPSAs or MUAs based on a systematic survey
- IT – 14.8 Percent of trainees who report that they plan to serve Medicaid populations based on a systematic survey

Relationship to other Projects:

1.1 (C3) - Increased training of workforce competent to staff the 'new primary care' model will facilitate the recruitment of providers for expansion of primary care capacity.

1.3 (C12) - Part of the innovative training of primary care providers will be centered on the role of chronic disease management, for which the registries are essential.

1.7 (A1) - Enhanced training will include education on telemedicine as a cost-effective alternative to the more traditional face-to-face access to specialty medical care consults.

2.1 (C1-2) - Increased training of workforce competent to staff the 'new primary care' model will facilitate the recruitment of providers ready to practice in a medical home setting.

2.2 (C5-9,CL3) - Part of the innovative training of primary care providers will be centered on the chronic care model, with emphasis on team-based practice.

2.11 (C10) - Structured educational training for health care providers on quality and cost control will entail instruction in medication therapy management for minimizing medication errors.

Relationship to Other Performing Providers' Projects in the RHP:

Our region is blessed with multiple academic organizations that are a recruitment ground for areas that are currently medically underserved, but there is a drastic need of additional residency programs due to existing class size and training programs. The residency program proposals will allow the organizations to benefit in workforce need for all other initiatives. There is a unique initiative in our region for the expansion of a residency program.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet that contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criterion, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs

(long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **5**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **1**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.1.2 X 2 = **2**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **1**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **1.75**

Project Option 1.2.2- 1.2 Increase training of primary care workforce: Training of Community Health Workers (CHWs)

Unique RHP Project ID: 111810101.1.3
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
University of Texas School of Public Health will partner with Gateway to Care, Harris Health System, and UT Physicians to increase the number of certified CHWs in the region (currently approximately 500) and respond to specific continuing education needs as identified by providers and CHWs. In addition, providers and clinic staff will be trained on how to integrate CHWs as members of the health care team.

Need for the project:
One of our identified community needs is that there is insufficient access to services that are specifically designed to address racial, ethnic and cultural health care disparities. CHWs are public health professionals who use their unique understanding of the experiences, language and/or culture of the population they serve to promote health, hence they have proven to be an important link between healthcare providers, researchers and disadvantaged communities.

Target Population:
This program targets, primarily, the adult Hispanic population (18 years and above) in our 4 service areas, which number approximately 552,660.

Category 1 or 2 expected patient benefits:
By DY4 the target will be to achieve improvement in trainee knowledge assessment scores of CHWs, and by DY5 to achieve improvement in trainee satisfaction with specific elements of the training program. We expect that CHWs satisfied and confident in their training, will facilitate better care for patients and greater participation in their self care, particularly for minority/underserved patients facing cultural barriers to quality health care.

Category 3 outcomes:
IT-11.5 (IT-2.10): Our goal is to reduce by 3% in DY4 and 5% in DY5, the percentage of all discharges with a principal diagnosis of flu or pneumonia among Hispanics aged 18 years and older who are patients of UT Physicians.

Project Option 1.2.2 – Increase Training of Primary Care Workforce: SPH1 Training of Community Health Workers (CHWs)

Unique RHP Project Identification Number: 111810101.1.3
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 1.2 Increase training of primary care workforce (Option 1.2.2)

This project will aid the reshaping of the health care system in Southeast Texas. The University of Texas School of Public Health (UTSPH) has a rich history of community health worker (CHW) training and is a state recognized training center. The UTSPH will partner with Gateway to Care, Harris Health System, and UT Physicians (UTP) to increase the number of certified CHWs in the region (currently approximately 500) and respond to specific continuing education needs as identified by providers and CHWs. Additionally, providers and clinic staff will be trained in how to integrate CHWs as members of the health care team.

Clinics implementing this team-based model will be matched with a clinic operating under the current practice model. Comparisons will be made based on: chronic disease management including diabetes, tobacco control, hypertension, prenatal care, and cancer screening and referral; immunization rates; return on investment; and quality of experience as reported by patients.

In the UTP service areas alone, there are large populations with economic, cultural, and language barriers to receiving health care. UTP has defined the service area for its clinics to include the census tracts within a seven-mile radius of each clinic. The Bayshore Clinic is in the southeast area of Houston and includes parts of Pasadena, South Houston, and areas immediate south of the ship channel. The service area of this clinic has a population of 431,199, with 36.5% living at/below the federal poverty level (FPL). The population is 49.2% Hispanic and of those, 51.1% are not proficient in English. The Bellaire Clinic, with a population of 472,698, is on the west side of Houston and also has a large minority population, with 24.1% Black/African American and 46% Hispanic, and 52.2% live at/below the FPL. Of the Spanish-speaking population in the Bellaire Clinic service area, 62.8% are not proficient in English. The Cinco Ranch (population 287,744) and Sienna Village (population 231,535) clinics serve populations reaching into Ft. Bend County that closely mirror the overall county demographics (23.7% Hispanic), with the exception of Sienna Village Clinic, which has a large Black/African American population of 33.5%. There are 20.8% of the Cinco Ranch Clinic population and 26.2% of the Sienna Village Clinic population living at/below the FPL. These two clinics also serve rural populations. Since the Hispanic population would especially benefit from the involvement of CHWs as a part of their health care team, and the large population of Hispanics living within the UTP service areas (approximately 552,660) and the rest of Harris County, this will be our target population. Furthermore, based upon the demographics of UTPs service areas, we expect that there is a greater rate of Medicaid/Medicaid-eligible clients to be served. However, using the overall Harris County rate (14.5%) of Medicaid clients, there would be at least an estimated 1,423,176 Medicaid clients living within the service areas of the UT Physician Clinics. (All population statistics are from the U.S. Census Bureau, 2010 Census. Poverty statistics are from the U.S. Census Bureau, Small Area Estimates Branch. Release date: 11.2011. Table 1: 2010 Poverty and Median Income Estimates - Counties. The Medicaid rate is from the

U.S. Census Bureau and the Centers for Disease Control and Prevention, State and County by Demographic and Income Characteristics. SAHIE, 2009.)

Goal and Relationship to Regional Goals:

Project Goal:

To increase availability and utilization of certified CHWs trained in organized care delivery models, with an emphasis on team-based practice, quality and cost control, that will serve as members of healthcare delivery teams.

This project addresses the following regional goal:

CHWs will be invaluable in helping the region achieve its goal to "transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system".

Challenges:

Need: 1) Lack of access to culturally appropriate care. 2) Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs.

Implementation: 1) Willigness of other providers/clinicians to incorporate CHWs in their care team. 2) Retention of trained CHWs.

CHWs have been proven to be effective in serving as linkages between patients and the health system, helping patients to navigate the daunting challenges posed by the fragmented nature of health care delivery on the US. Most CHWs come from the local population, are in touch with the community, and are better able to attend to the needs of patients by helping the system to deliver culturally sensitive care and by facilitating their access to health education and support, thereby providing an important and cost effective service to health care teams and to patients. Providers/clinicians will be trained onthe value that CHWs bring to the health care team and in how to incorporate them into the practice. The inclusion of CHWs into care teams in their community and competitive compensation will aid in the retention of trained CHWs.

5-Year Expected Outcome for Provider and Patients:

Several CHWs will have been trained for practice in the region, and more practices will have CHWs employed in team-based management models. Since CHWs are able to provide patients with culturally appropriate assistance, we would expect better adherence to a regular schedule of primary care and chronic disease treatment plans, thereby producing better health outcomes and reduced need for acute care services. Since 18.7% of the Harris County population is living in poverty (27.1% of children) and 66% of the population are minorities, with 41% being Hispanic, culturally appropriate assistance in navigating the healthcare system and treatment plans will be very important. The inclusion of CHWs into the community clinics and the safety net hospitals in Harris County has the potential to reach large populations of Medicaid and Medicaid-eligible clients. One of the specific improvements we expect to see is higher rates of vaccinations, so we will be measuring a reduction in admissions for influenza and pneumonia for Hispanic patients.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

CHWs are members of a team of public health professionals who use their unique understanding of the experiences, language and/or culture of the populations they serve to promote health. CHWs have proven to be an important link between healthcare providers, researchers and disadvantaged communities.

As leaders, CHWs bridge the gap between communities and the public health system – they are resource persons who act as liaisons between residents and health and human services. In the United States, CHWs have been a part of the health care delivery system since the 1960s. Their role has evolved over time and varies according to their work setting, which ranges from outreach workers in the community to clinic staff. CHWs have a broad skill set, including communication, leadership, advocacy, and both general and disease or condition-specific health knowledge. Duties performed by CHWs range from counseling and health education to basic clinical tasks (HRSA, 2007). Regardless of their work environment, CHWs are trusted members of the community in which they work and typically reflect the demographic characteristics of the area. Their knowledge of local culture and customs allows them to effectively deliver direct health messages to community members, provide services, connect them to local health and social services, and advocate on their behalf. Nationally and internationally, CHWs are viewed as part of the solution for achieving improved health status in rural and disenfranchised communities.

For many years CHWs have provided an array of health care services in different settings. Recently their role has been elevated, nationally and internationally, as opportunities for integrating CHWs into the health care delivery system are discussed. In 2009, the US Department of Labor recommended the creation of a Standard Occupational Classification for CHWs. This act opened the door for additional integration into the US health system. The 2010 Patient Protection and Affordable Care Act (health reform law) identified community health workers as having major roles in achieving the goals of health care reform. At the International level, the United Nations Millennium Development Goals (MDGs) acknowledge the importance of human capital. In an effort to progress toward meeting health-related MDGs, the World Health Organization recommends CHWs as a part of the health service workforce (Achieving the health-related MDGs. It takes a workforce! 2010).

This project aims to demonstrate improved health outcomes, return-on-investment, and increased patient satisfaction when CHWs are integrated into the health care team in clinics southeast Texas.

Project Components:

Through the Training of Community Health Workers (CHWs) Program, we propose to meet all required project components listed below.

a) Recruit and train more community health workers/promotoras,
b) Train providers and clinic staff on how to integrate CHWs as members of the health care team, and
c) Place CHWs with UT Physician healthcare teams, and other healthcare provider teams throughout the region.

Milestones and Metrics:

For the Training of Community Health Workers (CHWs) Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-2]: Expand primary care training for community health workers
Metric 1 [P-2.1]: Expand other primary care staff (community health workers) training programs
Milestone 2 [P-3]: Expand positive primary care exposure for residents/trainees
Metric 1 [P-3.3]: Include trainees/rotations in quality improvement projects

Improvement Milestones and Metrics:

Milestone 3 [I-11]: Increase primary care training and/or rotations
Metric 1 [I-11.6]: Improvement in trainee knowledge assessment scores
Milestone 4 [I-11]: Increase primary care training and/or rotations
Metric 1 [I-11.5]: Improvement in trainee satisfaction with specific elements of the training program

Unique community need identification numbers the project addresses:

This project addresses community needs CN.20 (Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs) and CN.22 (Insufficient access to services that are specifically designed to address racial, ethnic and cultural health care disparities).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This initiative is an expansion of an existing training program. This initiative proposes increasing the number of CHWs trained and placing more CHWs within health care teams in the area. However, there is a new element being added, which is the training of providers in how to integrate CHWs as members of the health care team.

Related Category 3 Outcome Measure(s):

OD-11 Addressing Health Disparities in Minority Populations

- IT-11.5 (IT-2.10) Select any other Category 3 outcome (PPAs, PPRs, or ED utilization) or a combination of non-standalone measures and target a specific minority population with a demonstrated disparity in the particular measure (Standalone measure) (IT-2.10 Flu and pneumonia Admission Rate)
  For the Hispanic population:
  Numerator: All discharges of age 18 years and older with a principal diagnosis code of flu or pneumonia.
  Denominator: Population in Metro Area or county, age 18 years and older.

Relationship to other Projects:

1.1 (C3) - The training of CHWs will increase the availability of support staff for the expansion of primary care capacity.

1.3 (C12) - The disease management registry will help identify patients that need active follow-up, for which CHWs will be uniquely qualified for outreach to non-compliant patients, facilitating their return to appropriate care.

1.7 (A1) - The telemedine technology will also be available for CHWs in their outreach activities and in facilitating patients' interaction with their healthcare team, particularly for those patients with distance/ transportation barriers.
2.1 (C1-2) - The increased training of CHWs competent to work with the 'new primary care' team-based model of care will be an important component of transitioning patients into medical homes.
2.2 (C5-9,CL3) - Part of the initiatives in the redesigning of chronic care delivery systems is to make better use of non-physician members of the team, such as the CHWs able to facilitate culturally-appropriate communication, education, and navigation, which are important components of the chronic care model.
2.11 (C10) - Trained CHWs able to facilitate culturally-appropriate communication, education, and navigation will be essential to the care team's medication therapy management for minimizing medication errors.

Relationship to Other Performing Providers' Projects in the RHP:

As the regional healthcare platform aggressively grows, so will the need of workforce expansion to accommodate the needs in order to achieve outcome measures. Workforce expansions range from physician to extender workforce needs and are reflected in the Region 3 Initiative grid in the addendum.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criterion, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **4**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **4**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the

project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.1.3 X 2 = **4**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **2**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **2.7**

Project Option 1.3.1- 1.3 Implement a Chronic Disease: UT Physicians Chronic Disease Registry

Unique RHP Project ID: 111810101.1.4
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
Data entered into a unique chronic disease registry will be used to pro-actively contact, educate, and track patients by disease status, risk status, self management status, community and family need. Reports drawn from the registry will be used to develop and implement targeted quality improvement plans for diabetes, hypertension, asthma, COPD, and CHF.

Need for the project:
Our service population has high rates of chronic disease, and there is lack of care coordination due to insufficient implementation and use of electronic health records. Utilization of registry functionalities will help our care teams to actively manage patients with targeted chronic conditions because the registry will include clinician prompts and reminders, which would aid in the delivery of proactive care.

Target Population:
This project targets patients in our service area with diabetes, hypertension, asthma, COPD, or CHF. Patients of lower socioeconmic status (which number approximately 448,583 for the UTP clinics service areas) are known to have worse disease control due to the inability to maintain compliance in the long run, hence this project will be beneficial to the Medicaid population in the UTP clinics service areas.

Category 1 or 2 expected patient benefits:
The milestone target for DY4 is to increase the percentage of patients enrolled in the registry. And by DY5 to increase the number of patient contacts recorded in the registry relative to baseline rate.

Category 3 outcomes:
IT-1.7: Our goal is to improve by 3% in DY4 and 5% In DY5, the percentage of UT Physician's patients (ages 18 to 85 years) with a diagnosis of hypertension, whose most recent blood pressure (BP) is adequately controlled (BP less than 140/90 mm Hg) during the measurement year.

Project Option 1.3.1 – Implement a Chronic Disease Management Registry: C12 UT Physicians Chronic Disease Registry

Unique RHP Project Identification Number: 111810101.1.4
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 1.3 Implement a Chronic Disease Management Registry (Option 1.3.1)

UT Physicians will implement and use chronic disease management registry functionalities. Data entered into a unique chronic disease registry will be used to pro-actively contact, educate, and track patients by disease status, risk status, self management status, community, and family need. Reports drawn from the registry will be used to develop and implement targeted QI plans for diabetes, hypertension, asthma, COPD, and CHF. Utilization of registry functionalities helps care teams to proactively manage patients with targeted chronic conditions because the disease management registry will include clinician prompts and reminders, which would aid in the delivery of proactive care to patients with chronic diseases. With the high rates of chronic diseases in RHP3 (CN.11), the use of a chronic disease registry will be an important tool in our ability to provide the best quality of care for patients with diabetes, hypertension, asthma, COPD, and CHF. UTP provided 321,716 patient visits during FY 2012. It is unknown at this time how many of these patients have a chronic disease, or which disease(s) they might have, since we do not currently have chronic disease registry. Whatever the number, we are expecting growth in patient visits by about 42,000 for primary care and 38,000 for specialty care due to expansion in these areas, which means that we will be providing over 400,000 patient visits by the end of DY5 (most of this growth is expected to be among Medicaid/Medicaid-eligible clients). With a patient base this large, a chronic disease registry will be not only key to providing proactive high-quality care, but will also allow us to identify trends to be addressed through interventions and quality improvement processes.

Through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:

Project Goal:

To track key patient information, thereby enabling physicians and other members of a patient's care team to identify and reach out to patients who may have gaps in their care in order to prevent complications, which often lead to more costly care interventions.

This project addresses the following regional goal:

By establishing disease specific registries, providers will have the benefit of a rich information source on the dynamics/progress of patients under their care. This taps into the regional goal that aims to "transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system."

Challenges:

Need: 1) Lack of care coordination and unnecessary duplication of services due to insufficient implementation and use of electronic health records. 2) High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease. Implementation: 1) Recruitment and training of case managers to run the registries. 2) Capacity to act on data output from registry.

In addition to the high rates of chronic diseases in the population, the failure to make maximum use of the support of clinical information technology has hampered the effective management of such diseases. Information technology, which is part of Wagner's chronic care model, has been shown to contribute positively to the delivery of a proactive care that keeps patients healthy as much as possible and achieve stable states in disease conditions by yielding timely actionable information.

5-Year Expected Outcome for Provider and Patients:

Chronic disease registries will have been created and incorporated into the care models for the targeted diseases for the delivery of proactive and coordinated care for patients with chronic diseases, such as cardiovascular disease/hypertension. We expect that improved care for these patients will result in better outcomes and less need for acute episodic care, thereby lowering ED utilization for patients with cardiovascular disease/hypertension. In addition to benefiting the current Medicaid (23% as of 2011, or 65,302 patient visits) and low-income client base of UTP clinics, the expansion of primary care and specialty care services will be marketed to the additional 1,423,176 Medicaid and Medicaid-eligible residents living within the service areas of the UT Physician Clinics with cardiovascular disease/hypertension. Since we are expecting growth in our clinics by at least 42,000 patient visits by the end of DY5, and we expect the growth to be primarily in the Medicaid/Medicaid eligible patients (raising our percentage of Medicaid patient visits) the use of the disease registry will potentially benefit a rather large number of people.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

Utilization of registry functionalities helps care teams to actively manage patients with targeted chronic conditions because the disease management registry will include clinician prompts and reminders, which would aid in the delivery of proactive care to patients with chronic diseases. The following statistics on select chronic diseases demonstrate the need for tools and processes that assist in the management of these diseases, such as the chronic disease registry.

Asthma is increasing every year in the US; the proportion of people with asthma in the United States grew by nearly 15% in the last decade. There is significant disparities in asthma prevalence in the US. Adults with an annual household income of $75,000 or less are more likely to have asthma than adults with higher incomes. (Asthma's Impact on the Nation: Data from the CDC National Asthma Control Program. Available at: http://www.cdc.gov/asthma/ impacts_nation/ AsthmaFactSheet.pdf. Accessed 10/15/12). Hence the Medicaid population has a higher prevalence of asthma. Asthma costs the US about $3,300 per person with asthma each year from 2002 to 2007 in medical expenses. Medical expenses associated with asthma increased

from $48.6 billion in 2002 to $50.1 billion in 2007. About 2 in 5 (40%) uninsured people with asthma could not afford their prescription medicines and about 1 in 9 (11%) insured people with asthma could not afford their prescription medicines. People with asthma can prevent asthma attacks if they are taught to use inhaled corticosteroids and other prescribed daily long-term control medicines correctly and to avoid asthma triggers. In 2008 less than half of people with asthma reported being taught how to avoid triggers. (CDC 2011: Asthma in the US. Available at: http://www.cdc.gov/vitalsigns/Asthma/#. Accessed 10/15/12).

Hispanics have a 66% higher risk of being diagnosed with diabetes than non-Hispanic whites and non-Hispanic blacks have a 77% higher risk. (2011 National Diabetes Fact Sheet, National Center for Chronic Disease Prevention and Health Promotion, Division of Diabetes Translation, Centers for Disease Control and Prevention. http://www.cdc.gov/diabetes/pubs/estimates11.htm#8 Last reviewed and updated May 23, 2011. Accessed 10-11-12.). About 40% of Harris County residents are of Hispanic origin (U.S. Census Bureau, 2010 Census Summary File 1), compared to 16.3% of the US population. Uncontrolled diabetes can result in complications with dire consequences for the patient. For example, the risk of stroke is 2 - 4 times higher among people with diabetes; diabetes is the leading cause of new onset blindness among adults aged 20 - 74 years in the US; nearly half of all cases of kindey failure can be attributed to diabetes; and more than half of all caes of nontraumatic lower limb amputations are because of poorly controlled diabetes. Diabetes also predisposes patients to dental diseases, pregnancy complications, among other problems. Overall, the risk for death among people with diabetes is about twice that of people of similar age but without diabetes. Studies in the United States have shown that improved glycemic control benefits people with either type 1 or type 2 diabetes. In general, every percentage point drop in A1c blood test results (e.g., from 8.0% to 7.0%) can reduce the risk of microvascular complications (eye, kidney, and nerve diseases) by 40%. After adjusting for population age and sex differences, average medical expenditures among people with diagnosed diabetes were 2.3 times higher than what expenditures would be in the absence of diabetes. Hence achieving good glycemic control among our diabetic patients will save the health system a lot of resources.

Around 5.8 million people in the United States have heart failure and about 670,000 people are diagnosed with it each year. About one in five people who have heart failure die within one year from diagnosis but early diagnosis and treatment can improve quality of life and life expectancy for people who have heart failure. Heart failure results in significant costs to the system; it cost the US nearly $40 billion in 2010 (CDC 2010: healrt failure facts. Available at: http://www.cdc.gov/dhdsp/data_statistics/fact_sheets/docs/fs_heart_failure.pdf. Accessed on 10/15/12).

Chronic lower respiratory diseases, primarily COPD, are the third leading cause of death in the United States, and 5.1% of U.S. adults report a diagnosis of emphysema or chronic bronchitis (Morbidity and Mortality Weekly Report (MMWR) March 2, 2012 / 61(08);143-146. Available at: http://www.cdc.gov/mmwr/preview/mmwrhtml/mm6108a3.htm?s_cid=mm6108a3_w. Accessed 10/15/12). Excess health-care expenditures are estimated at nearly $6,000 annually for every COPD patient in the United States (Deaths from Chronic Obstructive Pulmonary Disease - United States, 2000--2005. November 14, 2008 / 57(45);1229-1232. Available at: http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5745a4.htm. Accsessed 10/15/12), Uncontrolled COPD leads to deterioration in lung function and eventually death.)

In 2009-2010, the age-adjusted percentage of US adults with hypertension whose blood pressure was contolled was 53.3%. So nearly half of all hypertensive patients have poor blood

pressure control.Yet hypertension is a leading cause of stroke, coronary artery disease, heart attack, and heart and kidney failure in the United States, all of which contribute to the rising costs of health care. Aggressive treatment of hypertension, significantly decreases the risk of coronary artery disease, congestive heart failure, stroke, and resulting disability. For example, a 12-point to 13-point reduction in blood pressure can lower the risk of heart attack by 21%, stroke by 37%, and total cardiovascular deaths by 25% (Rein DB, Constantine RT, Orenstein D, Chen H, Jones P, Brownstein JN, et al. A cost evaluation of the Georgia Stroke and Heart Attack Prevention Program. Prev Chronic Dis [serial online] 2006 Jan [date cited]. Available from: URL: http://www.cdc.gov/pcd/issues/2006/jan/05_0143.htm. Accessed on 10/15/12). Low-income individuals without prescription drug coverage are significantly more likely to skip doses to save money or make their hypertension medication prescriptions last longer. (Rein DB, Constantine RT, Orenstein D, Chen H, Jones P, Brownstein JN, et al. A cost evaluation of the Georgia Stroke and Heart Attack Prevention Program. Prev Chronic Dis [serial online] 2006 Jan [date cited]. Available from: URL: http://www.cdc.gov/pcd/issues/2006/jan/05_0143.htm. Accessed on 10/15/12).

Project Components:

Through the UT Physicians Chronic Disease Registry Program, we propose to meet all required project components listed below.

a) UTP will develop a chronic disease registry to track and monitor patients with diabetes, hypertension, asthma, COPD, and CHF,
b) Test and validate the accuracy of the registry, and
c) Train UTP faculty & staff on how to use the registry to proactively contact, educate, and track patients by disease status, risk status, self-management status, community and family need.
d) UTP's quality improvement office will use registry reports to develop and implement a targeted QI plan, and
e) Conduct quality improvement for the project using methods such as rapid cycle improvement.

Milestones and Metrics:

For the UT Physicians Chronic Disease Registry Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-1]: Identify one or more target patient populations diagnosed with diabetes, hypertension, asthma, COPD, or CHF.

Metric 1 [P-1.1]: Proportion of patients with diabetes, hypertension, asthma, COPD, and CHF targeted and entered into the registry

Milestone 2 [P-3]: Develop cross-functional team to evaluate registry program.

Metric 1 [P-3.1]: Documentation of personnel (clinical, IT, administrative) assigned to evaluate registry program

Improvement Milestones and Metrics:

Milestone 3 [I-15]: Increase the percentage of patients enrolled in the registry.

Metric 1 [I-15.1]: Percentage of patients in the registry

Milestone 4 [I-16]: Increase the number of patient contacts recorded in the registry relative to baseline rate.

Metric 1 [I-16.1]: Total number of in-person and virtual (including email, phone and web-based) visits, either absolute or divided by denominator.

Unique community need identification numbers the project addresses:

This project addresses community needs CN.11 (High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease) and CN.24 (Lack of care coordination and unnecessary duplication of services due to insufficient implementation and use of electronic health records).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

The Chronic Disease Management Registry project respresents a new initiative, since this does not currently exist. This initiative will improve our ability to provide pro-active patient-centered care for those with chronic diseases, track these patients, and ensure adherance to treatment plans.

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Chronic Disease Management

- IT-1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018)12 (Stand-alone measure)

Improve the number of patients 18 to 85 years of age with a diagnosis of hypertension,whose most recent blood pressure (BP) is adequately controlled (BP less than 140/90 mm Hg) during the measurement year.

<u>Relationship to other Projects:</u>

1.1 (C3) - Expanded primary care capacity will enable the effective use of the outputs of the disease management registries to bridge gaps for at-risk patients.

1.7 (A1) - Reports from the disease management registry can be transmitted to a specialist at a distant site using telemedicine facilitating quality care.

1.9 (C4) - The disease management registry will serve as a useful resource to every specialty provider involved in managing the enrolled patients.

1.10 (MS1) - The chronic disease registries will make available useful QI data that will be used to populate the QI dashboards under project MS1.

2.1 (C1-2) - The disease management registry will serve as a useful resource to every member of the medical home care team involved in managing the enrolled patients.

2.2 (C5-9,CL3) - The disease management registry (Information Technology support) is a very improtant component of Wagner's Chronic Care Model being implmented in these projects.

2.11 (C10) - The disease management registries and the medication management project will complement each other to ensure patients with chronic diseases, especially those with multiple chronic conditions, get optimal care with minimal errors and sustained active follow up.

2.12 (A3, CL1, CL2, MS4) - The disease management registry will provide important technological support to the care transitions projects with the aim of tracking patients to ensure adequate, sustained follow up.

<u>Relationship to Other Performing Providers' Projects in the RHP:</u>

The sheer volume of population as well as the complexity of patient conditions dictates the need of numerous disease registries in our region to properly identify and manage chronic conditions. The concept is utilized consistently throughout our region in order to help achieve milestones and outcomes specific to patient conditions. All disease registries presented have a

similarity in concept but are unique in the sense of condition or patient population focus. The Region 3 initiative grid in the addendum reflects direct relations between all projects.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criteria: **4**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criteria: **2**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criteria: 111810101.1.4 X 2 = **2**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criteria: **2**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar, ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **1.9**

Project Option 1.6.2- 1.6 Enhance Urgent Medical Advice: UT Health Nurse-line Medical Triage Call Center

Unique RHP Project ID: 111810101.1.5
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
This project will expand access to medical advice and guidance to the appropriate level of care in order to reduce emergency department use for non-emergent conditions, and it will also increase patient access to health care by implementing a nurse-line medical triage call center that will be staffed 24/7/365.

Need for the project:
Our existing nurse line is partial (only exists in two clinics), not-centralized, not available all day and all week round, and does not have full Spanish options. There is need to make the service more culturally sensitive and accessible by expanding the service in Spanish, having a centralized line, and making it available round-the-clock. This will address the need to provide the right care in the right setting at the right time, and hence reduce primary care related emergency department visits.

Target Population:
All current and prospective clients of UTP. However, patients with chronic diseases, such as chronic obstructive pulmonary diseases, asthma, heart failure, pulmonary edema, Hypertension, Angina, or Diabetes are likely to benefit the most. In FY 2012, UTP provided 321,716 patient visits. With UTPs planned expansion of primary care and specialty care capacity, we expect to provide over 400,000 patients visits by DY5.

Category 1 or 2 expected patient benefits:
By DY4 we will increase the number of patients that access the nurse advice line, and by DY5 the target will be to increase patients in the defined population who utilized the nurse advice line and were given an urgent medical appointment via the line when needed.

Category 3 outcomes:
IT-2.11: Our goal is to reduce by 3% in DY4 and 5% in DY5, the percentage of acute care hospitalizations for ambulatory care sensitive conditions for persons under the age 75 years.

Project Option 1.6.2 – Enhance Urgent Medical Advice: C11 UT Health Nurse-line Medical Triage Call Center

Unique RHP Project Identification Number: 111810101.1.5
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 1.6 Enhance Urgent Medical Advice (Option 1.6.2)

UT Physicians (UTP) will expand access to medical advice and direction to the appropriate level of care to reduce Emergency Department use for non-emergent conditions and increase patient access to health care by implementing a nurse-line medical triage call center that will be staffed 24/7/365. The nurses receiving the calls will have access to the UT Physicians Schedule Now system to find an appropriate physician to see the patient in a primary care setting for non-emergent conditions. Furthermore, for patients needing urgent medical guidance who are already patients of UT Physicians, the nurses will have access to their EMR through Allscripts. Also, UT Health will be participating in the local public hospital HIE with Memorial Hermann to provide patients with the ability to participate in an HIE for enhanced patient care and provider communication as well as enhanced PI and QI initiatives. This will further enhance the triage nurse's ability to access pertinent information when advising callers.

The UT Physicians practice includes over 900 physicians located in the Texas Medical Center and in 4 out-lying clinics, which provides patients with greater access to care. In FY 2012, UTP provided 321,716 patient visits. With UTPs planned expansion of primary care and specialty care capacity, we expect to provide over 400,000 patients visits by DY5. The nurse triage line will be an important tool in the provision of appropriate care to clients and in avoiding unnecessary Emergency Department use.

Finally, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:

Project Goal:

To provide urgent medical advice so that patients who need it can access it telephonically, and an appropriate appointment can be scheduled so that access to urgent medical care is increased and avoidable utilization of urgent care and the ED can be reduced.

This project addresses the following regional goal:

This project relates to the regional goal that aims to "develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is

responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction", since it is going to expand the existing nurse line to better meet the needs of patients.

Challenges:

Need: 1) High rates of inappropriate emergency department utilization. 2) High rates of preventable hospital admissions.

Implementation: 1) Low health literacy levels and low economic resources of the population can influence the ability to effectively utilize the nurse line. 2) Marketing.

By providing readily available triage services patients can conveniently get guidance and advice on non-urgent medical issues and be able to get an appointment set up with a primary care physician when necessary. This will keep people away from the ED. This program will be aggresively advertised to the target population thereby getting them informed about the availability of this free service and increasing its uptake.

5-Year Expected Outcome for Provider and Patients:

We would have a fully functional nurse line and there will be marketing and education of patients (in English and in Spanish) on the availability of the service and how to use it. We expect to record increased uptake of the triage services which would decrease admissions for ambulatory care sensitive admissions. In addition to benefiting the current Medicaid (23% as of 2011, or 65,302 patient visits) and low-income client base of UTP clinics, the expansion of services will be marketed to the additional 1,423,176 Medicaid and Medicaid-eligible residents living within the service areas of the UT Physician Clinics. Since 18.7% of the Harris County population is living in poverty (27.1% of children) and 66% of the population are minorities, with 41% being Hispanic, culturally appropriate assistance in accessing appropriate care will be important in avoiding hospitalizations for ambulatory care sensistive conditions.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

This project will expand the existing nurse line to become available all day and all week round, in order to be there when needed by patients. It will also be made more culturally sensitive by expanding to offer the service in Spanish and it will be marketed widely to inform the target poulation of its availability. With the provision of the triage service from nurses who have access to their records at the time of call, patients will be able to recieve the right care at the right time, thereby preventing inappropriate use of the ED and quickening the process of getting appointment for urgent primary care needs. This project will address the need to provide the

right care in the right setting at the right time, and the need to reduce primary care related emergency department visits.

Project Components:

Through the UT Health Nurse-line Medical Triage Call Center Program, we propose to meet all required project components listed below.

a) UTP will develop a 24/7/365 call center staffed by registered nurses that provide timely triage for patients seeking urgent healthcare guidance. Those than can be addressed through primary care services will be either given appointments with an appropriate provider in a timely manner (even same day appointments), or be directed to an alternate primary care site.
b) The UTP nurse triage line will be available in both English and Spanish.
c) Marketing and educational material on use of the nurse triage line will also be in both English and Spanish.
d) UTP Nurses on the triage line will have access to the appointment scheduling system and to patient records.
e) Communication processes will be developed between UTP Nurses and other primary care providers, urgent care providers, and Emergency Departments to improve care transitions for patients.
f) UTP will conduct surveys of patients using the nurse advice line to ensure patient satisfaction with the services received.
g) The UTP quality improvement office will conduct QI for the project using methods such as rapid cycle improvement.

Milestones and Metrics:

For the UT Health Nurse-line Medical Triage Call Center Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-4.]: Expand nurse advice line by XX% based on baseline data to increase access to patients based on need within the RHP.
Metric 1 [P-4.1.]: Number of nurses staffing advice line per shift and number of patient calls per shift
Milestone 2 [P-5.]: Establish a multilingual nurse advice line
Metric 1 [P-5.1.]: Number of bi-lingual nurses staffing advice line per shift
Milestone 3 [P-6.]: Inform and educate patients on the nurse advice line
Metric 1 [P-6.1.]: Number of targeted patients informed/educated
Milestone 4 [P-7.]: Develop/distribute a bilingual (English and Spanish) patient-focused educational newsletter with proactive health information and reminders based on nurse

advice line data/generated report identifying common areas addressed by the nurse advice line.
Metric 1 [P-7.1.]: Newsletter distribution

Improvement Milestones and Metrics:

Milestone 5 [I-13.]: Increase in the number of patients that accessed the nurse advice line
Metric 1 [I-13.1.]: Utilization of nurse advice line
Milestone 6 [I-14.]: Increase patients in defined population who utilized the nurse advice line and were given an urgent medical appointment via the nurse advice and appointment line when needed
Metric 1 [I-14.1.]: Number of urgent medical appointments scheduled via the nurse advice line

Unique community need identification numbers the project addresses:

This project addresses community needs CN.8 (High rates of inappropriate emergency department utilization) and CN.10 (High rates of preventable hospital admissions).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

The Nurse-line Medical Triage Call Center project is an expansion of what is mainly an appointment line at this time. UT Physicians currently has a line that patients, or would-be patients can call to be matched with a physician, but it does not operate except during business hours and it does not routinely provide consultation with a nurse for urgent needs. This project proposes to operate a medical triage call center, staffed 24/7/365 by nurses who will have access to patient records and provide guidance to patients regarding next steps that include arranging for same-day appointments in a primary care setting where the need is more urgent.

Related Category 3 Outcome Measure(s):

OD-2 Potentially Preventable Admissions

- IT-2.11 Ambulatory Care Sensitive Conditions Admissions Rate: (Standalone measure)

Numerator: Total number of acute care hospitalizations for ambulatory care sensitive conditions under age 75 years (including any one most responsible diagnosis code of: Grand mal status and other epileptic convulsions, Chronic obstructive pulmonary diseases, Asthma, Heart failure and pulmonary edema, Hypertension, Angina, and Diabetes). Exclusions: Individuals 75 years of age and older, or death before discharge.

Denominator: Total mid-year population under age 75

Relationship to other Projects:

1.10 (MS1) - The systems engineering and dashboard project will provide a system for continuous quality improvement in the service provided by the nurse triage line.
2.1 (C1-2) - The medical home project and the nurse line will complement each other to ensure that patients get the right care at the right time.

2.9 (A4) - The nurse line will complement the care navigation program, as a 24/7 point of contact, further reducing the risk of avoidable utilization of the ED.
2.11 (C10) - The medication management program with its technological support will provide the nurses with useful information on patients to inform more efficient triaging.
2.12 (A3, CL1, CL2, MS4) - The nurse triage line will complement the care transition projects, as a 24/7 point of contact to ensure that patients get the right care at the right time.

Relationship to Other Performing Providers' Projects in the RHP:

The triage and intake process of patient encounters is the front door to healthcare and an important factor of the success of healthcare transformation. The nurse triage/call center concept is unique in the regional sense of the RHP plan and focuses to outcome measures of ambulatory care sensitive condition readmission rates. The initiative grid attached in the addendum will show similarities with other projects suggested for this region.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **6**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **5**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the

project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.1.5 X 2 = **5**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **7**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **4.25**

Project Option 1.7.1- 1.7 Introduce, Expand, or Enhance Telemedicine/Telehealth: UT Health Telemedicine

<u>Unique RHP Project ID:</u> 111810101.1.6
<u>Performing Provider Name/TPI:</u> UTHealth, UTPhysicians / 111810101

<u>Project Summary:</u>

<u>Provider:</u>
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

<u>Intervention(s):</u>
A telemedicine program will be established to provide access to the UT Health Regional Multispecialty Physician Group, by means of a rapid e-mail and/or internet based and technologically driven consultation process that will manage complicated diabetic cases and other patients who would otherwise require a referral and visit to specialists. We will recruit dedicated specialists, physician assistants and nurse practitioners to manage the process. A dedicated website will be set up for formal consultations.

<u>Need for the project:</u>
Our region has a shortage of primary and specialty care physicians, inadequate transportation options for patients in distant locations and for indigent/low income populations, and inadequate access to specialty care. The use of technology to deliver health care from a distance, has been demonstrated as an effective way of overcoming certain barriers to care.

<u>Target Population:</u>
All people and primary care physicians outside the Houston metropolitan area and rural areas of Region 3, where there is not access to specialty care.

<u>Category 1 or 2 expected patient benefits:</u>
The goal is to increase number of telemedicine visits for each specialty identified as high need.

<u>Category 3 outcomes:</u>
IT-6.1 (3): Our goal is to increase by 3% in DY4 and 5% in DY5, the improvement over baseline (for patients of non-UT Physician primary care practices that accessed the specialty care services via the Telemedicine program) of patient satisfaction scores for patient's rating of doctor access to specialist using the adult CG-CAHPS survey module.

Project Option 1.7.1 – Introduce, Expand, or Enhance Telemedicine/Telehealth: A1 UT Health Telemedicine

Unique RHP Project Identification Number: 111810101.1.6
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 1.7 Introduce, Expand, or Enhance Telemedicine/Telehealth (Option 1.7.1)

A telemedicine program will be established that provides access to the UT Health Regional Multispecialty Physician Group. Due to the high demand for services from specialists at clinics in the area, patients wait a long time (as much as 4-6 months) to receive consultation, and it is inconvenient and expensive to travel to specialty clinics. We propose to develop a rapid e-mail and/or internet based/technologically driven consultation process to manage complicated diabetes and other patients who would otherwise require a referral and visit to specialists. We will recruit dedicated specialists, physician assistants and nurse practitioners to manage the process. A dedicated website will be set up for formal consultations. After completion of a patient-specific survey, the E-consult team will provide specific management recommendations to the primary care physician within 72 hours. The E-consult team will also maintain a database of all consults and track outcomes through e-mail communications with PCP's. Finally, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:
Project Goal:
To reduce disparities in access, outcome, cost and satisfaction that are created by geographic barriers by means of electronic health care services
This project addresses the following regional goal:
One of the goals of the region is to "Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay." The telemedicine project will help the attainment of this goal by making it possible for the pool of specialists at UT Health to become reachable to diverse groups of patients even in remote parts of the region.

Challenges:
Need: 1) Shortage of primary and specialty care physicians. 2) Inadequate transportation options for individuals in distant locations and for indigent/low income populations. 3) Inadequate access to specialty care.
Implementation: 1) Technological challenges. 2) Reimbursement issues.
Telemedicine is in an innovative way to address the inadequate supply and distribution of physicians in the region, especially with regards to remote populations. It will also minimize

challenges posed by transportation barriers. The DSRIP funds will make it possible to offset the costs of this project to the benefit of the target population.

5-Year Expected Outcome for Provider and Patients:

Telemedicine will have become part of the health system, scaling-up the delivery of specialty health services to underserved areas, and resulting in increased access to specialty care in our region. Texas has large rural areas and Region 3 is no exception. For the 9-county area of Region 3, there is an estimated 1.2 million people uninsured and another 1+ million with some type of public covereage, including Medicaid. Only Harris county has a large urban population. The remaining 8 counties are primarily rural. The ability to extend specialty consultation services, accepting the Medicaid and Medicaid-eligible clients, to the primary care physicians and their clients in these areas is expected to have a positive impact on the health of these patients who might otherwise not get the needed care and end up in need of acute care services. Improved access to specialty care services is expected to result in improved patient satisfaction as well.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

One of the greatest challenges facing the U.S. healthcare system is to provide quality care to the large segment of the population, which does not have access to specialty physicians because of factors such as geographic limitations or socioeconomic conditions. The use of technology to deliver health care from a distance, has been demonstrated as an effective way of overcoming certain barriers to care. For instance, telemedicine can ease the gaps in providing crucial care for those who are underserved, principally because of a shortage of sub-specialty providers. Our region has problems of access to both primary an specialty care as reflected in the regional community needs assessment.

The development and installation of high-speed wireless telecommunications networks coupled with large-scale search engines and mobile devices will change healthcare delivery as well as the scope of healthcare services. It will allow for real-time monitoring and interactions with patients without bringing them into a hospital or a specialty care center. This real/near-time monitoring and interacting could enable a healthcare team to address patient problems before they require major interventions, creating a potentially patient-centered approach that could undoubtedly translate to magnificient improvement in outcomes.

Project Components:

Through the UT Health Telemedicine Program, we propose to meet all required project components listed below.

a) UTP will conduct an assessment of both the locations where telemedicine would fill a gap in specialty care and determine the specialties that can be provided via telemedicine.
b) UTP will work with primary care providers to complete any needed legal agreements and establish the technology and processes needed to provide consultations services.

c) UTP will recruit providers and support staff to manage the telemedicine program and processes.
d) UTP providers in the specialties determined through the needs assessment and other related health professionals will provide patient consultations using telecommunications.
e) UTPs quality improvement office will conduct QI for the project using methods such as rapid cycle improvement.

Milestones and Metrics:

For the UT Health Telemedicine Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY3.

Process Milestones and Metrics:

Milestone 1 [P-1.]: Conduct needs assessment to identify needed specialties that can be provided via telemedicine

Metric 1 [P-1.1.]: Needs assessment to identify the types of personnel needed to implement the program and hiring of the respective personnel.

Milestone 2 [P-3.]: Implement or expand telemedicine program for selected medical specialties, based upon regional and community need.

Metric 1 [P-3.1.]: Documentation of program materials including implementation plan, vendor agreements/ contracts, staff training and HR documents.

Milestone 3 [P-3.]: Implement or expand telemedicine program for selected medical specialties, based upon regional and community need.

Metric 1 [P-3.2]: Documentation of the number of consults delivered by each specialty

Improvement Milestones and Metrics:

Milestone 4 [I-12.]: Increase number of telemedicine visits for each specialty identified as high need

Metric 1 [I-12.1]: Number of telemedicine visits

Milestone 5 [I-12.]: Increase number of telemedicine visits for each specialty identified as high need

Metric 1 [I-12.2.]: RHPs and providers should provide analysis demonstrating how the telemedicine services provided align with their needs assessment.

Unique community need identification numbers the project addresses:

This project addresses community needs CN.2 (Inadequate access to specialty care), CN.16 (Shortage of primary and specialty care physicians) and CN.21 (Inadequate transportation options for individuals in rural areas and for indigent/low income populations).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project is an expansion of a service that is currently only offered sparingly. We propose to expand our telemedicine program to provide primary care physicians and their patients, who are in more distant locations, access to specialty consultations.

Related Category 3 Outcome Measure(s):
OD-6 Patient Satisfaction

- IT-6.1 (3) Percent improvement over baseline of patient satisfaction scores: (3) patient's rating of doctor access to specialist; (Stand-alone measure)

Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients: (3) patient's rating of doctor access to specialist; (patients of other primary care practices that accessed the specialty care services via Telemedicine program)

Relationship to other Projects:

1.1 (C3) - The expansion of primary care capacity and access to health care services will also result in an increased demand for specialty care. Specialty care consults provide via telemedicine will be an important resource in the primary care setting.

1.2 (A2, SPH1) - Enhanced training will include education on telemedicine as a cost-effective alternative to the more traditional face-to-face way of providing medical care.

1.6 (C11) - For patients in distant locations, the nurse triage line will be able to arrange consults via telemedicine were appropriate.

2.1 (C1-2) - Via telemedicine, the UT Health Multispecialty Physician Group will serve as a Virtual Acountable Care Organization (ACO) that will provide an extensive network of specialty support centers for primary care providers, built on the concept of "advanced medical home".

2.2 (C5-9,CL3) - Telemedicine will ensure that chronic care patients will get specialist input into their care when needed, without the current delays being experienced.

2.11 (C10) - The medication management project will ensure that patient medications are managed in a coordinated manner even with inputs and prescriptions from specialists at different sites.

2.12 (A3, CL1, CL2, MS4) - Telemedicine will provide a valuable resource during the care transition processes, further ensuring that patients get the right care at the right time.

Relationship to Other Performing Providers' Projects in the RHP:

An innovative approach to increasing access to primary care and specialty care has been created by the miracles of the internet and computer systems. Telemedicine is leading edge for those communities who cannot easily access behavioral health or specialty care due to remote locations, lack of physicians, or urgency of encounter needs. Numerous telemedicine projects have been proposed, as seen in the Region 3 Initiative grid in the addendum, and all focus to outcomes such as appropriate emergency department utilization, 30-day readmission rates, and patient satisfaction scores.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **7**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **4**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.1.6 X 2 = **6**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **6**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **4.3**

Project Option 1.9.2- 1.9 Expand Specialty Care Capacity: Expand UT Physician Specialty Services to Outlying Clinics

Unique RHP Project ID: 111810101.1.7
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
UT Physicians will recruit specialists for each of its outlying clinics. Clinic service hours will be extended to provide evening and weekend appointment options. Standardized referral systems will be put in place to ensure access to these specialists.

Need for the project:
Inadequate access to specialty care has contributed to the limited scope and size of safety net health systems, and our region has problems of access to specialty care as reflected in the regional community needs assessment.

Target Population:
The service areas of our 4 outlying clinics include large populations with economic, cultural, language, and transportation barriers to receiving primary care. Using the Harris County rate (14.5%) of Medicaid clients, there are an estimated 1,423,176 Medicaid clients living within the tightly-defined service areas of the UT Physician Clinics. With a minimum of 4 FTE specialty providers, we expect to reach approximately 38,000 specialty patient visits by DY5.

Category 1 or 2 expected patient benefits:
The DY4 goal is to increase the number of specialist providers, clinic hours and/or procedure hours available for the high impact/most impacted medical specialties, and by DY5 to increase the number of referrals of targeted patients to the specialty care clinic.

Category 3 outcomes:
IT-1.1: Our target is to reduce by 1 day over baseline in DY4, and by 2 days in DY5, the average length of time in days between the day a patient makes a request for an appointment with a physician and the third next available appointment for a new patient, or return visit/exam. The ultimate goal is to decrease number of days to third next available appointment to two days for Specialty Care.

Project Option 1.9.2 – Expand Specialty Care Capacity: C4 Expand UT Physician Specialty Services to Outlying Clinics

Unique RHP Project Identification Number: 111810101.1.7
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 1.9 Expand Specialty Care Capacity (Option 1.9.2)

UT Physicians (UTP) will recruit specialists for each of its outlying clinics, based upon the specialty care gap assessment to be conducted for each of these service areas. We intend to place at least 1 FTE specialist at each of the 4 UTP clinics described below, but expect that the gap assessment will identify a need for more than 1 specialty at some of the clinics (particularly the two clinics providing service in the Ft. Bend County area, where there is a dearth of specialty providers). We expect to see a need for endocrinologists, pulmonologists, and cardiologists, but will accommodate other specialties, depending upon the outcome of the gap assessment. This will enable expansion of UT Health specialties in areas outside the Texas Medical Center and into other areas where economic and transportation barriers exist and where there is a great need for ambulatory care (see below description of UTP service areas targeted by this project). At a minimum of 4 FTE specialists, this expansion would enable approximately 15,200 patient visits per year (based on 3,800/yr/specialist FTE), with a potential to reach over 38,000 patient visits by the end of DY5. Clinic service hours will be extended including evening and weekend appointment options in order to further increase access to these services. Standardized referral systems will be put in place to ensure access to these specialists. Also, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project to ensure that we are delivering the right care to those in need, where it is needed. We will also use these QI processes to identify challenges for further expansion and to build on lessons learned.

UT will market the availability of specialty services to the UTP clinic service areas, which has been defined as the Census Tracts within a seven-mile radius of the clinic, which includes large numbers of medically underserved, low income, and Medicaid/Medicaid-eligible populations. The Bayshore Clinic is in the southeast area of Houston and includes parts of Pasadena, South Houston, and areas immediately south of the ship channel. The service area of this clinic has a population of 431,199, with 36.5% living at/below the federal poverty level (FPL). The population is 49.2% Hispanic and of those, 51.1% are not proficient in English. The Bellaire Clinic, with a population of 472,698, is on the west side of Houston and also has a large minority population, with 24.1% Black/African American and 46% Hispanic, and 52.2% live at/below the FPL. Of the Spanish-speaking population in the Bellaire Clinic service area, 62.8% are not proficient in English. The Cinco Ranch (population 287,744) and Sienna Village (population 231,535) clinics serve populations reaching into Ft. Bend County that closely mirror the overall county demographics, with the exception of Sienna Village Clinic, which has a large

Black/African American population of 33.5%. There are 20.8% of the Cinco Ranch Clinic population and 26.2% of the Sienna Village Clinic population living at/below the FPL. These two clinics also serve rural populations. Furthermore, according to a 2011 report of the Texas Medical Board, Ft. Bend County has a dearth of specialty providers compared to Harris County (76.5 fewer per 100,000 population) and the Texas average (44.1 fewer per 100,000 population). The service areas of these 4 clinics include large populations with economic, cultural, language, and transportation barriers to receiving primary care. Using the Harris County rate (14.5%) of Medicaid clients, there are an estimated 1,423,176 Medicaid clients living within the service areas of the UT Physician Clinics. (All population statistics are from the U.S. Census Bureau, 2010 Census. Poverty statistics are from the U.S. Census Bureau, Small Area Estimates Branch. Release date: 11.2011. Table 1: 2010 Poverty and Median Income Estimates - Counties. The Medicaid rate is from the U.S. Census Bureau and the Centers for Disease Control and Prevention, State and County by Demographic and Income Characteristics. SAHIE, 2009.)

Goal and Relationship to Regional Goals:

Project Goal:

To increase the capacity to provide specialty care services and the availability of targeted specialty providers to better accommodate the high demand for specialty care services so that patients have increased access to specialty services.

This project addresses the following regional goal:

The region aims to "Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay." By expanding specialty care services, patients will have greater access to specialty care when needed.

Challenges:

Need: 1) Inadequate access to specialty care. 2) Insufficient access to care coordination and integrated care treatment programs.

Implementation: 1) Staff recruitment and retention. 2) Coordination of specialty care and primary care appointments.

As the physician practice arm of the world-class academic and research institution, University of Texas Health Science Center-Houston, UTP is uniquely positioned to attract and retain new physicians. Also, since the UTP primary care clinics are already established, the integration of specialty care services will be a smoother transition than establishing completely new clinics. All providers and staff will be trained and a quality improvement process will be put in place to ensure that we achieve optimum coordination of services.

5-Year Expected Outcome for Provider and Patients:

There will be shortening of waiting times for specialty care appointments, such as for cardiology care, and better disease management for those with targeted chronic diseases. In addition to benefiting UTP's current Medicaid population (23% as of 2011, or 65,302 patient visits), these expanded services will be available to the low-income client base of UTP clinics, particularly the additional Medicaid and Medicaid-eligible residents (1,423,176) living within the service areas of the UT Physician Clinics. The expansion of service hours to nights and

Saturdays will be of particular benefit to those unable to see a physician during business hours. The increase in specialty care capacity, coupled with our transition to the team-based, proactive healthcare delivery model of medical homes, all conveniently located where there is great need, will help to address many of the barriers that the low-income population typically encounter in getting the appropriate care, facilitating better health outcomes. While positive outcomes are expected for each area of specialty care offered, we will specifically be monitoring the increased access to cardiology care for patients at risk of, or with heart disease. It is expected that increased access to cardiology care for these patients will result in increased cholesterol screening, better management of heart disease, and lower LDL-C rates.

Starting Point/Baseline:
To be determined during DY3.

Rationale:
Inadequate access to specialty care has contributed to the limited scope and size of safety net health systems, and our region has problems of access to specialty care as reflected in the regional community needs assessment. To achieve success as an integrated network, this gap must be thoroughly addressed by expanding specialty care services to underserved populations. The availability of specialists to provide care in this area will allow patients to access care where and when needed, thereby potentially reducing the need for emergency care, complications, and hence improve the overall health and wellbeing of the community.

Project Components:
Through the Expand UT Physician Specialty Services to Outlying Clinics Program, we propose to meet all required project components listed below.

a) UTP will conduct a specialty care gap assessment for the service areas of our primary care clinics.
b) UTP will recruit specialists of the type identified in the gap assessment to provider specialty services in the UTP primary care clinics.
c) Space will be identified and secured at the primary care clinics and additional support staff recruited to support the provision of specialty care in each of the clinics.
d) UTP will provide specialty services in the primary care clinics, which will include extended evening and Saturday hours.
e) UTP will implement transparent, standardized referrals across the system.
f) UTP's quality improvement office will conduct QI for each of the clinics providing specialty care using methods such as rapid cycle improvement.

Milestones and Metrics:
For the Expand UT Physician Specialty Services to Outlying Clinics Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-1.]: Conduct specialty care gap assessment based on community need

Metric 1 [P-1.1.]: Documentation of gap assessment. Demonstrate improvement over prior reporting period (baseline for DY2).

Milestone 2 [P-3.]: Collect baseline data for wait times, backlog, and/or return appointments in specialties

Metric 1 [P-3.1.]: Establish baseline for performance indicators

Milestone 3 [P-6.]: Develop and implement standardized referral and work-up guidelines

Metric 1 [P-6.1.]: Referral and work-up guidelines

Milestone 4 [P-11]: Launch/expand a specialty care clinic

Metric 1 [P-11.1]: Establish/expand specialty care clinics

Improvement Milestones and Metrics:

Milestone 5 [I-22]: Increase the number of specialist providers, clinic hours and/or procedure hours available for the high impact/most impacted medical specialties

Metric 1 [I-22.1.]: Increase number of specialist providers, clinic hours and/or procedure hours in targeted specialties

Milestone 6 [I-29.]: Increase the number of referrals of targeted patients to the specialty care clinic

Metric 1 [I-29.1.]: Targeted referral rate

Unique community need identification numbers the project addresses:

This project addresses community needs CN.2 (Inadequate access to specialty care) and CN.7 (Insufficient access to care coordination practice management and integrated care treatment programs).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

Currently, only 2 out of our 4 outlying clinics provide specialty care to patients, and even in these clinics the specialist services provided are limited. Thus this project will enhance our capacity to deliver specialty care, and represents a signifcant expansion of an existing program.. This expansion is needed in the service areas of these clinics, which serve areas that include large populations with economic, cultural, language, and transportation barriers to receiving care.

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Chronic Disease Management

- IT-1.1 Third next available appointment (Non- standalone measure)
  Reduce the average length of time in days between the day a patient makes a request for an appointment with a physician and the third available appointment for a new patient, or return visit/exam. The goals will be to decrease number of days to third next available appointment to two days for Specialty Care.

OD-1 Primary Care and Chronic Disease Management

- IT-1.6 Cholesterol management for patients with cardiovascular conditions (NCQA-HEDIS 2012) (Standalone measure)
  Increase the number of patients who had each of the following during the reporting period:
  Low-density Lipoprotein Cholesterol (LDL-C) Screening: An LDL-C test performed during the measurement year.
  LDL-C Level Less Than 100 mg/dL: The most recent LDL-C level during the measurement year is less than 100 mg/dL.

Relationship to other Projects:

2.2 (C5-9,CL3) - This project will ensure that chronic care patients get specialist input into their care when needed, without the current delays being experienced.

2.11 (C10) - The medication management project will serve as a useful resource to every provider involved in managing the enrolled patients, to ensure optimum outcomes.

2.12 (A3, CL1, CL2, MS4) - The exansion of specialty care into the primary care settings will complement the care transition projects to ensure that patients get the right care at the right time.

Relationship to Other Performing Providers' Projects in the RHP:

The increased access to primary care visits will naturally generate additional need of specialty care visits based on the condition and acuity of the patients served. Understanding that the patient base targeted through this initiative will generate significant specialty care visits due to chronic conditions and lack of previous treatments, this initiative and similar initiatives will focus to 30-day readmission rate reductions, improvement for patient satisfaction scores, and admission rates specific to chronic conditions. Numerous initiatives have been included in the RHP plan and the addendum of the Initiative Grid can directly tie all specialty care projects together by category.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **7**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **5**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the

project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.1.7 X 2 = **7**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **5**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **4.55**

Project Option 1.10.2- 1.10 Enhance Performance Improvement and Reporting Capacity: UT Health Regional Systems Engineering Center and UT Health Quality Improvement (QI) Dashboard Development Center

Unique RHP Project ID: 111810101.1.8
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
The project will develop a regional systems engineering center, that will recruit systems engineers to integrate with healthcare QI teams to cross train in applying systems engineering science to healthcare processes, and develop interdisciplinary courses for healthcare professionals, students, engineers and administrative healthcare leadership. The project will also develop QI capacity at UT Health by developing specialty-specific QI dashboards that will integrate QI data from various institutions, measure, report monthly specialty specific data, and serve as the engine to drive, conduct and rapidly diffuse quality and patient safety improvements.

Need for the project:
Performance improvement and reporting is a large component of success of all of the project areas across the DSRIP project categories. The majority of medical errors result from faulty systems and processes, not individuals; because of this reason it is important to adopt process improvement techniques to identify inefficiencies, ineffective care, and preventable errors.

Target Population:
The service areas of our 4 outlying clinics. With the expansion of primary and specialty care access to a potential population of another 1,423,176 Medicaid and Medicaid-eligible clients, we expect to provide access to an additional 80,000 patient visits, most of which are expected to be Medicaid/Medicaid-eligible clients (based on the demographics of the UTP clinics service areas).

Category 1 or 2 expected patient benefits:
By DY4 the goal will be to increase the number of reports generated through the QI data systems, and by DY5 to have put in place the quality dashboard.

Category 3 outcomes:
IT-4.8: Our goal is to reduce by 3% in DY4 and 5% in DY5, the percentage of patients expiring during current month hospitalization with sepsis, severe sepsis, or septic shock and/or an infection and organ dysfunction.

Project Option 1.10.2 – Enhance Performance Improvement and Reporting Capacity: MS1 UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center

Unique RHP Project Identification Number: 111810101.1.8
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 1.10 Enhance Performance Improvement and Reporting Capacity (Option 1.10.2)

Development of a UT Health regional systems engineering center that will embed proven evidence-based industrial and systems engineering improvement methods such as Lean, Six Sigma, and Care Logistics into local healthcare organizations to significantly improve care, reduce errors, reduce cost, improve safety and overall quality of healthcare delivered to our patients. The center will recruit systems engineers that will integrate with healthcare quality improvement teams to cross train in applying systems engineering improvement science to major healthcare processes., and develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement. The center will also develop interdisciplinary courses for healthcare professionals, students, engineers and administrative healthcare leadership. The center will review major quality improvement projects and partner with quality improvement teams to embed industrial and systems engineering methodology into the design.

In addition, the project will develop quality improvement capacity at UT Health by developing specialty specific quality improvement dashboards through a central center that will integrate quality improvement (QI) data from various institutions and national reporting agencies, measure, report monthly specialty specific data, and serve as the engine to drive, conduct and rapidly diffuse quality and patient safety improvements. The center will interface with various sites (Harris County Hospital District, Memorial Hospital System, UT Health outpatient centers) to obtain clinical data to populate the Quality Dashboards that will be developed for each clinical specialty based on specialty specific key quality metrics (CMS, AHRQ, etc). Through the Quality Dashboards, UT Health will measure, report, support quality improvement projects and drive change with rapid diffusion of key successful process between departments and between organizations.

Goal and Relationship to Regional Goals:
Project Goal:

To expand quality improvement capacity throughout the organization so that the resources are in place to conduct, report, drive and measure quality improvement, and to implement process improvement methodologies to improve safety, quality, and efficiency.

This project addresses the following regional goal:

This project is anchored on the rgional goal that aims to "develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes." This will be achieved

partly by establishing learning processes and putting in place mechanisms for effective application and sharing of QI lessons learned.

Challenges:

Need: 1) High rates of preventable hospital admissions. 2) High rates of preventable hospital readmissions.

Implementation: 1) Recruitment and retention of systems engineers. 2) Training of systems users. 3) Willingness of regional health institutions to collaborate on QI partnerships

This project will put quality at the forefront of the health care transformation agenda in the region. Potentially preventable hospital admissions and readmissions are few of the manifestations of failure the system to provide quality care. Such issues are what the quality improvement processes that will be ushered in by this project will address. The project will also create the avenue for different health care organizations in the region to collaborate on quality improvement.

5-Year Expected Outcome for Provider and Patients:

By adopting various process improvement techniques to identify inefficiencies, ineffective care, and preventable errors, patients of UT Physicians, including the current Medicaid (23% as of 2011, or 65,302 patient visits) and low-income client base, will be safer and experience better health outcomes including fewer potentially preventable readmissions and mortality due to sepsis. With the other projects of UTP in expanding primary and specialty care access to a potential population of another 1,423,176 Medicaid and Medicaid-eligible clients, we expect to provide access to an additional 80,000 patient visits, most of which are expected to be Medicaid/Medicaid-eligible clients (based on the demographics of the UTP clinics service areas). The outcome of our quality improvement efforts to ensure the best evidence-based care will surely impact the health of many people.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

Performance improvement and reporting is a very large component of success of all of the project areas across the DSRIP project categories. The health industry is in need of quality and safety improvement initiatives (Martin LA, Nelson EC, Lloyd RC, Nolan TW. Whole System Measures. IHI Innovation Series white paper. Cambridge, Massachusetts: Institute for Healthcare Improvement; 2007. (Available at: http://www.ihi.org/knowledge/Pages/IHIWhitePapers/WholeSystemMeasuresWhitePaper.aspx, accessed 10/11/12) Quality health care is defined as "the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge"(AHRQ: Measures Sought for National Quality Measures Clearinghouse. Available at: http://www.ahrq.gov/qual/nqmcmeas.htm, accessed 10/11/12). According to the Institute of Medicine (IOM), the majority of medical errors result from faulty systems and processes, not individuals. Because errors are caused by system or process failures, it is important to adopt various process improvement techniques to identify inefficiencies, ineffective care, and preventable errors to then influence changes associated with systems. This is what this project aims to achieve for the UTHealth system and other health institutions in the

region. Each of the various techniques involves assessing performance and using the findings to inform change. Strategies and tools for quality improvement include failure modes and effects analysis, Plan-Do-Study-Act, Six Sigma, Lean, and root-cause analysis, and these have been used succesfully to improve the quality and safety of health care.(The Denver Health LEAN Academy: Lean Results. Available at: http://www.denverhealth.org/LEANAcademy/AboutLEANAcademy/CaseStudies.aspx)

Project Components:

Through the UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center Program, we propose to meet all required project components listed below.

a) UTP will establish a performance improvement office to collect, analyze, and manage real-time data and to monitor the improvement trajectory and improvement activities across the UT Physicians's delivery system.
b) UTP will recruit and/or train quality improvement staff in well-proven quality and efficiency improvement principles, tools and processes, such as rapid cycle improvement, and/or data and analytics staff for reporting purposes.
c) UTP will develop an employee suggestion system that allows for the identification of issues that impact the work environment, patient care and satisfaction, efficiency and other issues aligned with continuous process improvement.
d) UTP will design data collection systems and processes to collect real-time data, which will be used to drive continuous quality improvement.

Milestones and Metrics:

For the UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-1]: Establish a performance improvement office to collect, analyze, and manage real-time data and to monitor the improvement trajectory and improvement activities across the UT Physicians's delivery system

Metric 1 [P-1.1]: Documentation of the establishment of performance improvement office

Milestone 2 [P-6]: Hire/train quality improvement staff in well-proven quality and efficiency improvement principles, tools and processes, such as rapid cycle improvement and/or data and analytics staff for reporting purposes (e.g., to measure improvement and trends)

Metric 1 [P-6.1]: Increase number of staff trained in quality and efficiency improvement principles

Improvement Milestones and Metrics:

Milestone 3 [I-7]: Implement quality improvement data systems, collection, and reporting capabilities

Metric 1 [I-7.1]: Increase the number of reports generated through these quality improvement data systems

Milestone 4 [I-8]: Create a quality dashboard or scoreboard to be shared with organizational leadership and at all levels of the organization on a regular basis that includes outcome measures and patient satisfaction measures

Metric 1 [I-8.1]: Submission of quality dashboard or scorecard

Unique community need identification numbers the project addresses:

This project addresses community needs CN.9 (High rates of preventable hospital readmissions) and CN.10 (High rates of preventable hospital admissions).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project represents a new initiative. UT Physicians have not previously had access to these types of tools and processes for quality improvement.

Related Category 3 Outcome Measure(s):

OD-4 Potentially Preventable Complications and Healthcare Acquired Conditions

- IT-4.8 Sepsis mortality (Standalone measure)

Reduce the percentage of patients expiring during current month hospitalization with sepsis, severe sepsis or septic shock and/or an infection and organ dysfunction.

Relationship to other Projects:

1.3 (C12) - The chronic disease registries created under project C12 will make available useful QI data that will be used to populate the QI dashboards this project (MS1) seeks to create.

2.1 (C1-2) -This project will enhance quality improvement processes that will aid in identifying opportunities for continuous improvement in the functioning of the medical homes.

2.2 (C5-9,CL3) - This project will aid in the adoption of a 'whole systems' approach to chronic disease management, enabling the implementation of a comprehensive and proactive approach to chronic care, in which the patient is kept in continuos contact with the care team.

2.11 (C10) - The QI initiatives that will result from the implementation of this project will interact with the medication management program for the reduction of medication errors and noncompliance, providing a system for continuous quality improvement.

2.12 (A3, CL1, CL2, MS4) -Transitions in setting of care—for example from hospital to home or nursing home, or from facility to home and community-based services—have been shown to be prone to errors. This project (MS1) relates with these 4 care transitions projects by putting in place the right processes and systems to ensure that potential errors associated with care transitioning are avoided.

Relationship to Other Performing Providers' Projects in the RHP:

Innovation is key to the transformation of healthcare in our community. The consistency of innovation in our region allows for increased improvements based on research trends, patient need, and provider availability. The waiver funding allows for innovation in specific areas and all innovative projects included in the plan are similar in the fact of program redesigns for historic treatments, and focus to chronic condition outcome measures such as central line infections. The Region 3 initiative grid in the addendum can provide a side by side comparison of all projects that directly relate to innovation.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **4**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **2**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.1.8 X 2 = **2**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **2**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **1.9**

The University of Texas Health Science Center - Houston

Pass 2

Project Option 1.1.1 – Establish more primary care clinics: New North Harris County Healthcare Clinic

Unique RHP Project ID: 111810101.1.9
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians (UTP) has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
UT Physicians will establish the North Harris County Primary Care Clinic. Space will be leased to open the clinic, which will include consulting, exam and procedure rooms. The clinic will offer expanded evening and weekend hours to improve access to care. Primary care providers and support staff will be recruited to operationalize the project.

Need for the project:
UTP has defined the service area for this clinic as a priority for primary care services, because of its high rate of poverty. Although the need in the defined service area for this project is so great that it could support many primary care clinics, there is currently only one community health clinic that serves the indigent population.

Target Population:
The target population are those living in an area of Harris County that is between FM 1960 to the north, Cypress Creek Pkwy to the Northwest, Veteran's Memorial Drive to the west, Aldine Mail Route to the south, and Highway 59N to the east. The population in this area is estimated to be 196,900, out of which 48,244 persons are living below the federal poverty level.

Category 1 or 2 expected patient benefits:
Our DY4 goal is to increase primary care clinic volume of visits over prior reporting period. For DY5, the goal is to increase primary care clinic volume of visits for unique patients.

Category 3 outcomes: (by DY 5)
IT-1.1 Reduce the time to third next available appointment for a new patient physical, routine exam, or return visit exam to zero (0) days, for primary care.
IT-12.1 Increase by 5% the percentage of women patients of UT Physicians aged 40 to 69 that have received an annual mammogram during the reporting period.
IT-12.3 Increase by 5% the percentage of adult patients of UT Physicians aged 50 to 75 that have received one of the following screenings: Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, or Colonoscopy every 10 years.

Project Option 1.1.1 – Establish more primary care clinics: New North Harris County Healthcare Clinic

Unique RHP Project Identification Number: 111810101.1.9 / Pass 2
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 1.1 Expand Primary Care Capacity (Option 1.1.1)

UT Physicians (UTP) intends to address the shortage of primary and specialty care in Region 3. In this project, UTP will establish the North Harris County Primary Care Clinic, which will provide primary care for the population in an area of Harris County that is between FM 1960 to the north, Cypress Creek Pkwy to the Northwest, Veteran's Memorial Drive to the west, Aldine Mail Route to the south, and Highway 59N to the east. UTP has defined the service area for this clinic as a priority area for primary care services, because it is an area with a high rate of poverty. The population in this area is estimated to be 196,900 and is made up of 34 census tracts (CTs): 20 of the 34 fall within the top 25% of all census tracts in Harris County with the greatest number of people living below the federal poverty level (FPL), with 9 of those falling within the top 10%. (The CTs in the above defined service area that fall within the top 25% of Harris County CTs with the highest number of people living below the poverty line are: 5511, 5503.01, 5501, 2415, 2405.02, 2227, 2226, 2225.03, 2225.01, 5506.03, 5504.02, 5504.01, 5503.02, 5502, 5337.01, 5336, 2407.01, 2404, 2401, and 2230.02.) A total of 48,244 people in our defined service area are living below the FPL and a total of 99,482 are living below 185% of FPL. Furthermore, this area has a high rate of Hispanics (53.7%), for whom language, as well as poverty, may pose a barrier to obtaining primary care for their children. Black/African Americans, another segment of the population that tend to be medically underserved, also make up a significant proportion of the population (32.6%). Using the Harris County rate (14.5%) of Medicaid clients, there would be an estimated 28,551 Medicaid clients living within this service area. However, since this area has an exceptionally high rate of poverty, the number of Medicaid, or Medicaid-eligible clients, is expected to be much higher than this. (All population statistics are from the U.S. Census Bureau, 2010 Census. Poverty statistics are from the U.S. Census Bureau, Small Area Estimates Branch. Release date: 11.2011. Table 1: 2010 Poverty and Median Income Estimates - Counties. The Medicaid rate is from the U.S. Census Bureau and the Centers for Disease Control and Prevention, State and County by Demographic and Income Characteristics. SAHIE, 2009.) The service area for this clinic includes large populations with economic, cultural, language, and transportation barriers to receiving primary care. In order to address the unique needs of this community in the north Harris County area, UTP has chosen to establish a primary care clinic in this area as an independent DSRIP project.

In order to implement this project, UTP will lease additional space to open the North Harris County Healthcare clinic. This space will include additional consulting, exam and procedure rooms. The clinic will offer expanded evening and weekend hours to improve access to low-wage workers, who often work in jobs that do not grant paid time off for illness, or healthcare related needs. UTP will recruit additional primary care providers and support staff to operationalize the project. UTP is uniquely positioned to attract and retain new physicians, because it is a part of the world-class academic and research institution, The University of Texas Health Science Center-Houston. Although the need in the defined service area for this project is so great that it could support many primary care clinics, there is currently only one community

health clinic that serves the indigent population (Harris Health's Aldine Health Center) and it is on the southern-most border of our defined service area. Harris Health has not proposed any further clinics in this area, but UTP will collaborate with them to ensure that our clinic is placed optimally to provide the greatest convenience to the population without risking duplication of services provided by Harris Health. Furthermore, since this primary care clinic will provide services to the adult population, it will not duplicate services to be provided through Memorial Hermann Hospital's proposed North Harris County Pediatric Clinic, but rather complement these services.

Goal and Relationship to Regional Goals:

Project Goals:

Expand primary care capacity to better accommodate the needs of the regional patient population and community, so that patients have enhanced access to the right health care services, at the right time, in the right setting.

This project addresses the following regional goals:

One of the goals of the region is to "Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay". Expansion of primary care capacity certainly relates to this goal as it will make it easier for UT Physicians to provide care to underserved populations.

Challenges:

Need: 1) Inadequate access to primary care. 2) High rates of inappropriate emergency department utilization.

Implementation: 1) Staff recruitment and retention. 2) Marketing of expansion.

By expanding the capacity of their clinics, UT Physicians will be better able to deliver timely care to more patients when needed thereby diverting patients away from the emergency room. UT Physicians will recruit physicians from the UTHealth residents placed at Memorial Hermann Hospital-TMC and will offer them a competitive salary and other incentives to practice in the outlying clinics. A marketing campaign that addresses the culture(s) and needs of the community will be implemented to inform the community of our expanded capacity to provide quality care that is convenient for them.

5-Year Expected Outcome for Provider and Patients:

There will be shortening of waiting times for primary care appointments and increased uptake of primary care services in our service areas, which will increase the percentage of patients who receive appropriate primary health care, including preventative services, regular screenings, and monitoring for those patients with chronic illnesses. UT Physicians expects to see an uptake of regular screenings particularly for breast cancer and colon cancer. Detecting cancer early can reduce the burden of the disease in terms of both improved health outcomes and lower costs.

Starting Point/Baseline:

UTHSC-H has identified the targeted service area needing increased access to primary care. Since this will be a new clinic, the baseline will have to be established during DY3.

Rationale:

Research has shown that access to primary care is associated with better health outcomes at less cost. Access to primary care ensures better preventive care and better management of chronic disease, with lack of access often resulting in more expensive care, received in hospitals and emergency departments (ED). For the fiscal year 2010, 10% of all potentially preventable hospitalizations (PPR) were ambulatory care sensitive. In 2009, 41% (390,945) of ED visits in Houston were primary care related (PCR), including non-urgent, primary care treatable, and primary care preventable, and for 26.8% (104,762) of these PCR visits, Medicaid was the payor. Getting more patients into primary care will help to reduce the use of this more costly care. Placing more primary care providers out in the communities served by the UT Physcians will help to address transportation access barriers and the expansion of clinic service hours will provide a greater selection of available appointment times. By increasing primary care capacity and engaging more people in the primary care system, avoiding inappropriate utilization of costly services, the community will experience better health outcomes and greater patient satisfaction. (PPR rate was from the Texas Health and Human Services Commission report on Potentially Preventable Readmissions in the Texas Medicaid Population, Fiscal year 2010, published January, 2012. The statistics for ED use were from the Houston Hospitals Emergency Deaprtment Use Study (January 1, 2009 through December 31, 2009), Final Report, prepared by the UT School of Public Health, May 2011, included in the 2010 Harris County Community Needs Assessment for Memorial Hermann.)

Project Components:

Through the New North Harris County Healthcare Clinic, we propose to:

a) Identify and lease appropriate space within the defined service area to establish a new clinic.
b) Once leased, we will recruit primary care physicians and support staff.
c) The clinic will operate with expanded evening and Saturday hours to increase access.

Milestones and Metrics:

For the Expand Existing Primary Care Capacity at UT Physicians Clinics Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-1]: Establish an additional primary care clinic
Metric 1 [P-1.1]: Number of additional clinics.
Milestone 2 [P-5]: Hire additional primary care providers and staff
Metric 1 [P-5.1]: Documentation of increased number of providers and staff.
Milestone 3 [P-4]: Expand the hours of a primary care clinic, including evening and/or weekend hours
Metric 1 [P-4.1]: Increased number of hours at primary care clinic over baseline

Improvement Milestones and Metrics:

Milestone 4 [I-12]: Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.
Metric 1 [I-12.1]: Documentation of increased number of visits. Demonstrate improvement over prior reporting period.

Milestone 5 [I-12]: Documentation of increased number of visits. Demonstrate improvement over prior reporting period.
Metric 1 [I-12.2]: Documentation of increased number of unique patients.

Unique community need identification numbers the project addresses:
This project addresses community needs CN.1 (Inadequate access to primary care) and CN.8 (High rates of inappropriate emergency department utilization).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
UT Physicians operates 4 clinics that serve areas that include large populations with economic, cultural, language, and transportation barriers to receiving primary care. This project proposes to add a new clinic in a different location where there is also a large population with economic, cultural, language, and transportation barriers to receiving primary care and where the demand for services is high. While this project is an expansion of UTP services in order to improve access to care, it is a new clinic in an area of great need.

Related Category 3 Outcome Measure(s):
OD-1 Primary Care and Chronic Disease Management

- IT-1.1 Third next available appointment (Non- standalone measure)
  Reduce the average length of time in days between the day a patient makes a request for an appointment with a physician and the third available appointment for a new patient physical, routine exam, or return visit exam. The goals will be to decrease number of days to third next available appointment to zero days (same day) for Primary Care.

OD-12 Primary Care and Primary Prevention

- IT-12.1 Breast Cancer Screening (HEDIS 2012) (Non-standalone measure)
  Numerator: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period. Denominator: Number of women aged 40 to 69 in the patient or target population. Women who have had a bilateral mastectomy are excluded.

OD-12 Primary Care and Primary Prevention

- IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)
  Numerator: Number of adults aged 50 to 75 that have received one of the following screenings. Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, Colonoscopy every 10 years
  Denominator: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.

Relationship to other Projects:
In addition to the UTP Pass-2 project for adding specialty services to this new primary care clinic in the North Harris County defined service area, in order to provide greater access to integrated care, this project is related to the below Pass 1 projects proposed by UT Physicians.
1.2 (A2, SPH1) - Increased training of primary care workforce will provide physicians and support staff needed to expand primary care capacity.
1.7 (A1) - Expanded primary care capacity will facilitate and enhance access to specialty care via telemedicine.

1.10 (MS1) - The systems engineering and user dashboards will give providers greater access to information and provide reports facilitating a continuous quality improvement process.
2.1 (C1-2) - As part of the medical home project, all patients will be assigned to a primary care provider within the UT Health medical home. Expanded primary care capacity will be a necessary step to making this possible.
2.2 (CL3, C5-C9) - Expanded capacity in primary care will ensure the availability of staff to implement the expansion of the chronic care management model for the targeted diseases.
2.11 (C10) - The medication management program will be an integral part of the coordinated care provided by the primary care physicians.
2.12 (A3, CL1, CL2, MS4) - For the various care transition projects to be succesful, UT Health needs to ensure it has adequate primary care capacity to handle the increased volume of patients.

Relationship to Other Performing Providers' Projects in the RHP:

Primary Care/Ambulatory Care clinics are a top priority to Region 3 due to the acuity of the regional patient mix, population concentration, and lack of primary care access points for our patient base. The regional approach of collaboration as well as existing patient referral pattern relationships allowed our team to properly identify the community needs based on the necessity of population, uninsured, and medically underserved patient bases. This program is consistent with our region and similar to numerous initiatives in our RHP plan sharing both concepts as well as outcome measures focused to percent improvement over baseline of patient satisfaction scores, reduction of inappropriate ED utilization, and third next available appointment status. The Region 3 Initiative Grid attached as a RHP Plan addendum reflects a grid of relationship for all initiatives.

Plan for Learning Collaborative:

UTP will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTP used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criteria: **8**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criteria: **8**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criteria: **10**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criteria: **6**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **6.1**

Project Option 1.9.2 – Expand Specialty Care Capacity: Expand UT Physician Specialty Services to North Harris County

Unique RHP Project Identification Number: 111810101.1.10
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:
Provider:
UT Physicians (UTP) is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.
Intervention(s):
UT Physicians will recruit specialists for the new primary care clinic in North Harris County. This will further enable expansion of UT Health specialty services to another area outside the Texas Medical Center. The new primary care clinic's service hours will be extended to provide evening and weekend appointment options, which will be covered by the UTP specialty services as well. Standardized referral systems will be put in place to ensure access to these specialists.
Need for the project:
This project addresses the county's inadequate access specialty care, especially for the service area for this clinic which includes large populations with economic, cultural, language, and transportation barriers to receiving healthcare. In order to address the unique needs of this community in Harris County, there is need to extend specialty care services to this area.Target Population:

The target population are those living in an area of Harris County that is between FM 1960 to the north, Cypress Creek Pkwy to the Northwest, Veteran's Memorial Drive to the west, Aldine Mail Route to the south, and Highway 59N to the east. The population in this area is estimated to be 196,900, out of which 48,244 persons are living below the federal poverty level.
Category 1 or 2 expected patient benefits:
Our DY4 goal is to increase the number of specialist providers, clinic hours and/or procedure hours available for the high impact/most impacted medical specialties, and by DY5 to increase the number of referrals of targeted patients to the specialty care clinic.
Category 3 outcomes: (by DY5)
IT-1.1 The goal will be to decrease number of days to third next available appointment to two days for Specialty Care.
Also, other category 3 outcome goals will be to increase by 5% the percentage of patients who had each of the following during the reporting period: Low-density Lipoprotein Cholesterol (LDL-C) Screening (performed during the measurement year), and LDL-C Level <100 mg/dL.

Tomball Regional Hospital

Pass 1

Project Option 1.1.2- Expand existing primary care capacity: Expand primary care access for uninsured populations within and around Tomball

Unique RHP Project ID: 131044305.1.1
Performing Provider Name/TPI: Tomball Regional Medical Center / 288523801

Project Summary:

Provider:
Tomball Regional Medical Center is a 358 bed acute care hospital located in Northwest Harris County. The hospital is a private for-profit facility that has provided $39.3m in uncompensated care for 2012 and $1.8m charity care.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 10,004 Births (babies delivered)- 709 Emergency visits- 32,935 Outpatient clinic visits- 78,088	Self-Pay- 9% Medicaid and CHIP- 15% Medicare- 34% Other Funding- 1% Commercial Insurance- 41%	Hispanic- 13% African American- 30% Caucasian- 50% Asian- 4% Other- 1% American Indian- 2%

Intervention(s):
This project will expand access to primary care for the uninsured by the hospital providing nurse practioner and office resources to the local indigent care clinic. This resource will allow the clinic to expand hours of coverage into the evenings.

Need for the project:
The purpose of this project is to provide treatment to the working uninsured for medical conditions that if managed timely will prevent the conditions from escalating to the point of needing treatment in a hospital setting. In 2012, the hospital treated 8,340 uninsured patients in the emergency setting

Target Population:
The target population will be the 8,340 uninsured emergency room patient and the estimated 10,000 citizens in the local market without medical coverage.

Category 1 or 2 expected patient benefits:
Our DY4 goal is to improve upon DY2 baseline of patient primary care visits by 5 patients per work day. Our DY5 goal is for 7 patient visits per day.

Category 3 outcomes:
IT-3.2: Our goal is to reduce COPD 30 day readmission rates by 3% of baseline in DY4 and 5% of baseline in DY5. IT -2.10 Our goal is to reduce uninsured hospital admissions for flu and pneumonia by 5%.

Project Option 1.1.2 – Expand existing primary care capacity: Expand primary care access for uninsured populations within and around Tomball.

Unique RHP Project Identification Number: 131044305.1.1
Performing Provider Name/TPI: Tomball Regional Medical Center / 288523801

Project Description:
Tomball Regional Medical Center (TRMC), the area's full service hospital, is proposing a Category 1 DSRIP project to expand primary care access for the uninsured population within and around The City of Tomball.

This project will allow patients to receive the right care at the right time in the right setting. The project will be a partnership of Tomball Hospital Authority (IGT partner), TOMAGWA Healthcare Ministries, a comprehensive family practice clinic, and Tomball Regional Hospital.

TRMC is proposing to provide the professional services of a mid-level provider and office staff to TOMAGWA, so that they may expand their services by providing expanded hours of clinic operations in their current location. TOMAGWA would provide the facilities. Additional facilities are not needed at this time as the clinic space is not used after 5:00pm. This mid-level provider would need to be supervised by a current licensed physician on the staff of TOMAGWA.

TOMAGWA would operate the clinic under its current reduced fee schedules and charity/indigent guidelines. This would improve access to care for the working uninsured that cannot afford to take off during business hours and pay normal physician office rates. We are currently proposing that the expanded hours of operations for this clinic would be from 5:00pm until 9:00pm Monday through Friday. Payment for each office visit would be based on the current TOMAGWA fee schedule and charity care guidelines.

Project Goals:
Expand the capacity of primary care to better accommodate the needs of the regional patient population and community, as identified by the RHP needs assessment, so that patients have enhanced access to services, allowing them to receive the right care at the right time in the right setting.

- Expanded hours to a see a targeted 10 patients per day
- Reduce preventable admissions by 4%
- Reduce readmissions by 4%
- Reduce overuse of the emergency room 5%

Starting Point/Baseline:
The clinic does not currently have after-hours operations. The baseline for the clinic visits would be zero. However, the hospital does see these patients via the emergency room and in the inpatient setting. The top acute care hospital admissions DRG's (excluding births) for Tomball Regional Medical Center for the eight months ending August 31, 2012 for Medicaid and uninsured patients are:

DRG	Number of Cases	Hospital Charges
Cellulitis w/o cc/mcc	**37**	**$967,678**
Esophagitis, Gastrent $ misc Digest disorders w/o MCC	**28**	**$610,525**

Chronic Obstructive Pulmonary Disease w MCC	**14**	**$455,147**

These admissions are identified as conditions that with proper treatment and patient educations may either be prevented or the severity can be reduced. By improving access to primary care providers these patients can receive the outpatient treatment and care plans that they have not been receiving or have been depending on the hospital emergency room to provide.

Rationale:

In our current system, more often than not, patients receive services in urgent and emergent care settings for conditions that could be managed in a more coordinated manner if provided in the primary care setting. This situation often results in more costly, less coordinated care and a lack of appropriate follow-up care. Patients may experience barriers in accessing primary care services secondary to transportation, cost, lack of assigned provider, physical disability, inability to receive appointments in a timely manner and a lack of knowledge about what types of services can be provided in the primary care setting. By enhancing access points, available appointment times, patient awareness of available services and overall primary care capacity, patients and their families will utilize the primary care system resulting in better health outcomes, patient satisfaction, appropriate utilization and reduced cost of services.

Project Components:

- **Expand primary care** clinic space
- Expand primary care clinic hours
- Expand primary care clinic staffing

Unique community need identification number the project addresses:

- CN.1 Inadequate access to primary care
- CN.2 Inadequate access to specialty care
- CN.6 Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly
- CN.7 Insufficient access to care coordination practice management and integrated care treatment programs
- CN.8 High rates of inappropriate emergency department utilization
- CN.11 High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease, including: Cancer, Diabetes, Obesity, Cardiovascular disease, Asthma, AIDS/HIV

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project proposes to add one practioneer and extend the hours of operation of the indigent care clinic. By increasing these available resources we will meet the following community needs.

<u>Related Category 3 Outcome Measure(s):</u>

- IT-2.5 Reduce admissions COPD
- IT-2.10 Flu and pneumonia Admissions rates
- IT-3.1 Potentially preventable re-admissions 30 day
- IT -9.2 ED appropriate utilization

Reasons/Rationale for selecting the outcome measures:
By making services and education available to the low income population, patient will be able to identify mild illnesses and receive treatment prior to the conditions requiring emergency services. This will shorten the recovery time and therefore improve the overall health of the patient population.

<u>Relationship to other performing providers' projects in RHP:</u>
Healthcare treatment cannot focus to only the acute or chronic encounter and properly treat the patient. It is critical that our region focuses to patient education and community education to ensure a proactive and responsive approach to healthcare needs. The education models represented in the Region 3 RHP plan can be identified in the Initiative Grid (addendum) and all focus to outcome measures such as appropriate utilization, patient satisfaction scores, and standalone chronic condition scores such as diabetes and asthma.

<u>Plan for Learning Collaborative:</u> We plan to participate in a region-wide learning collaborative as offered by the anchor for Region 3, Harris Health System. Our participation in this collaborative with other performing providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's health care system.

<u>Project Valuation:</u>
The value of the project is based on two parts:

1. Cost of expanding capacity via the staffing of the clinic with mid-level provider and support staff as detailed in the Category 1 table. With over 8,300 area population at or below the poverty guidelines, this supports the need for 3-4 primary care providers.
2. Payment reductions and reduced uncompensated care for reduced admissions, readmissions and ED visits.

B. Category II

Baylor College of Medicine

Pass 1

Project Option 2.1.1- Develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards: The Fifth Ward Model – Inter-professional Primary Care

Unique RHP Project ID: 082006001.2.1
Performing Provider Name/TPI: Baylor College of Medicine/082006001

Summary:
Provider: Baylor Family and Community Medicine partners with multiple community-based healthcare organizations in the Harris County region to provide high quality, evidence-based care to underserved areas.
Intervention: This project will provide high quality, accessible, low-cost primary healthcare for under- or uninsured patients.
Need for the Project: This clinic will serve patients in the Greater Fifth Ward area of Houston, which has been indentified by the U.S. Department of Health and Human Services as a medically underserved area.
Target Population: Under- and uninsured patients who do not currently have a medical home.
Category 2 Expected Benefits:

- The clinic will provide medical homes for up to 5,000 patients by DY5.
- Patients will receive comprehensive, coordinated services by an interprofessional team of practitioners.
- Patients will receive high quality care founded on evidence-based guidelines. Specific areas of clinical focus such as family planning, prenatal care or adolescent health care will be developed to meet the specific needs of the population.

Category 3 Outcomes:

- IT-1.10: Improve HbA1c control by 15% over baseline by DY5.
- IT-1.20: Improve weight management by 10% over baseline by DY5.
- IT-12.2: Improve cervical cancer screening by 10% over baseline by DY5.

Project Option 2.1.1- Develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards: The Fifth Ward Model – Inter-professional Primary Care

Unique RHP Project ID: 082006001.2.1
Performing Provider Name/TPI: Baylor College of Medicine/082006001

Project Description:

The Fifth Ward Model Inter-Professional Primary Care Practice Demonstration Project will bring together an interdisciplinary team of healthcare professionals including physicians, mid-level providers (nurse practitioners and physicians' assistants), nurses (RNs, LVNs), nursing assistants, clinical pharmacists (PharmDs), social workers, health educators, and mental health professionals (psychologists, licensed professional counselors) to provide interdisciplinary primary healthcare to patients residing in a medically underserved community of Houston (the 5th ward).

The practice will be located at the Pleasant Hill Baptist Church Center for Spiritual Growth, Health and Wellness, a facility focused on holistic health being developed in partnership with the 5th Ward Re-development Corporation; the Rice University Kinder Institute and Urban Health Program; the Duke Divinity School; YES Prep, an urban educational specialist; Can Do Houston, an urban food specialist; and the Baylor College of Medicine Department of Family and Community Medicine.

The primary care practice will be developed as a high performing Patient Centered Medical Home (PCMH), providing broad spectrum primary health care services including health promotion and disease prevention, care of acute illnesses and injuries, care of common chronic diseases, care of common mental health problems, well woman, prenatal and gynecological services, care of infants and children, geriatric care, rehabilitative and palliative care through a multidisciplinary primary care team, with each team member practicing at the "top" of his or her training and professional license. The practice will be certified as a level 3 Patient Centered Medical Home, use a modern electronic medical record with a secure patient internet portal, and provide high quality care based on the most current evidence-based clinical practice guidelines, continuously measuring and striving to improve its processes and care outcomes.

The practice will serve as a demonstration project and laboratory for training healthcare professional students to work in inter-professional teams, involving faculty and students from Baylor College of Medicine, Prairie View A&M University School of Nursing, the University of Houston School of Pharmacy, Department of Psychology and School of Social Work, the University of Texas School of Public Health, etc.

Goal(s) and Relationship to Regional Goal(s):

The goal of this project is to provide comprehensive, patient-centered primary care to patients who live in a medically underserved area. It relates to the regional goals by providing patient-centered, coordinated care. It also uses existing infrastructure by partnering with Pleasant Hill Baptist Church to build a clinic within its existing space.

Challenges and how to address:

Clinic leadership will be challenged to develop relationships with other integrated healthcare systems for the provision of specialty and hospital care services and to ensure seamless

integration with secondary and tertiary levels of care. The team will partner with other RHP DSRIP participants who are committed to ensuring access for this patient population. All professional staff must be open to developing and learning a new model of providing primary healthcare. One of the core components of the project is to engage all providers in process improvement so as to ensure their commitment to implementing successful care models.

5-Year Expected Outcome for Provider and Patients:
The goal is to increase access to primary care with achievement of NCQA recognition of the clinic as a PCMH. Expected outcomes also include improved immunization rates, cervical screening rates, HbA1c control and weight management, overall providing the best opportunity for the health and well-being of this community.

Starting Point/Baseline:
This is a new clinic; baseline data are not available and will be determined during the first year of the clinic opening.

Rationale:
This project will enhance healthcare value by increasing primary healthcare access to an underserved population of the community and decreasing their use of emergency rooms, as well as hospitalization for downstream complications that can be prevented with timely primary care (ambulatory sensitive conditions). Healthcare value will be enhanced by training learners from multiple healthcare professions in a high-performing, model Patient Centered Medical Home where high quality primary care is provided by an inter-professional team, resulting in more cost-efficient and higher quality care, i.e. higher value care. This contributes to the RHP goals by increasing access to patient-centered primary care.

Project Components:
The Inter-Professional Primary Care Clinic is proposed under option 2.1.1. The following project requirements will be completed over DY 2-5:

a) Utilize a gap analysis to assess the clinic's NCQA PCMH readiness. The gap analysis will be conducted in DY3 and DY4 in preparation for the NCQA application in DY4-5.
b) Conduct feasibility studies to determine necessary steps to achieve PCMH status. Feasibility studies will be completed in conjunction with the gap analyses.
c) Conduct educational sessions for practitioners, clinic staff and leadership about the PCMH model. Educational sessions will be conducted as new providers are hired and as the clinic prepares to apply for NCQA accreditation. Education will continue as a component of the quality improvement sessions in DY3-5.
d) Conduct quality improvement activities. This will be included as the teams develop and implement evidence-based clinical practice guidelines for the patient population served. Once the guidelines are implemented, they will be reviewed and updated annually based on lessons learned. (I-X.1, I-X.2)

Milestones & (Metrics):

- Process Milestones and Metrics: P-4 (P-4.1); P-5 (P-5.1); P-X (P-X.1)
- Improvement Milestones and Metrics: I-17 (I-17.2); I-19 (I-19.2); I-X (I-X.1, I-X.2, I-X.3)

Workforce development is one of the project cornerstones. Designing a curriculum for the inter-professional team is proposed as a DY2 milestone under option P-X. One proposed metric is to enter into agreements with local health professional schools to ensure trainees of all types have an opportunity to learn and participate in a PCMH environment. Subsequent metrics include expanding the number of health professions involved in the inter-professional training. The goal is to ensure many types of healthcare providers are trained in the PCMH model and have an opportunity to participate in care delivery improvement. The inter-professional team will develop evidence-based clinical practice guidelines and monitor patient outcomes monthly to drive process improvement and ensure high quality care. The specific guideline will be determined once the clinic has enrolled patients in order to ensure the guidelines represent the salient health issues of the patient population. Decision support tools (e.g. smart forms) will be embedded within the electronic health record (EHR). The monthly reports will measure adherence to the (process of care) guidelines as well as disease-specific outcomes of care. Success of these implemented guidelines will be measured further in the Category 3 outcomes, such as HbA1c control.

Unique community need identification number the project addresses:

- CN1 – Access to primary care
- CN4 – Coordinated care for chronic conditions
- CN6 – Improved immunization compliance

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

This clinic will transform delivery by training many types of healthcare providers in the PCMH model. All providers will be engaged in process improvement initiatives to ensure the delivery of continuous integrated care. The beneficiaries are patients who live in a medically underserved area, where access to care is limited at best, so this clinic will help fill that gap.

Related Category 3 Outcome Measures:

OD-1 Primary Care and Chronic Disease Management

- IT-1.10 – Diabetes care: HbA1c poor control (>9.0%)
- IT-1.20 – Weight management
- IT-12.2 – Cervical cancer screening (HEDIS 2012)

Reasons/rationale for selecting the outcome measure(s):

The Fifth Ward has been identified as a medically underserved area[197] and is predominantly comprised of residents who identify themselves as Black, Hispanic or Latino[198]. The Category 3 outcome measures selected below each address health care issues that affect minority and poor populations disproportionately. These specific measures will reflect the Fifth Ward Clinic's success in providing access to and improving utilization of preventive services.

Improvements in HbA1c control can improve patient quality of life and cost of care by reducing the lifetime incidence of blindness, end-stage renal disease (ESRD) and coronary artery

[197] U.S. Department of Health and Human Services, Health Resources and Services Administration. Find Shortage Areas: MUA/P by State and County. http://muafind.hrsa.gov/index.aspx. Accessed October 1, 2012

[198] United States Census 2010. 2010 Census Interactive Population Search. http://2010.census.gov/2010census/popmap/. Accessed October 1, 2012. Census Tracts 2111, 2113.

disease in patients with type 2 diabetes[199]. Black and Hispanic patients have higher rates of diabetes and higher mortality rates due to diabetes[200] than white patients. African Americans are more likely to develop ESRD. The Health of Houston Survey 2010 indicated that the Near Northside-Fifth Ward area of the city has the highest rate of diabetes in the city – 20 percent.

Weight management is a proposed outcome measure under option IT-1.20. According to the Health of Houston Survey in 2010, 32% of Houston area adults were obese, compared to 29% across the State of Texas[201] with a high prevalence among non-Hispanic blacks (51% higher) and Hispanics (21% higher)[202]. In the Near Northside-Fifth Ward area, 37 percent of residents are obese – again the highest rate in the city. Obese patients face a higher risk of developing diabetes[203], but weight loss can significantly reduce that risk[204]. Helping patients achieve healthier weights can reduce mortality and morbidity and their attendant costs associated with diabetes.

Improvements in cervical cancer screening can reduce the incidence of cervical cancer by as much as 93%, while also decreasing associated mortality and lowering treatment costs[205]. Black and Hispanic women have much higher rates of incidence and mortality when compared to the general population[206]. Additionally, this will reflect the success of providing access to preventive services at the clinic.

Relationship to Other Projects:

Like the Baylor Teen Health Clinic (project 082006001.1.1), the Fifth Ward Clinic will provide primary care services in a medically underserved area. However, the clinic is situated in a different geographic area and targets the entire family rather than a specific age cohort.

Relationship to Other Performing Providers in the RHP:

Primary Care/Ambulatory Care clinics are a top priority to Region 3 due to the acuity of the regional patient mix, population concentration, and lack of primary care access points for our patient base. The regional approach of collaboration as well as existing patient referral pattern relationships allowed our team to properly identify the community needs based on the necessity of population, uninsured, and medically underserved patient bases. This program is consistent with our region and similar to numerous initiatives in our RHP plan sharing both concepts as

well as outcome measures focused to percent improvement over baseline of patient satisfaction scores, reduction of inappropriate ED utilization, and third next available appointment status. The Region 3 Initiative Grid attached as a RHP Plan addendum reflects a grid of relationship for all initiatives.

Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The value of this project was determined by an econometrics assessment of access to primary care, immunizations and cervical screening, as well as the care and risks associated with obesity and diabetes. The value assigned to primary care is based on cost avoidance of emergency room visits. The difference between the cost of an emergency room visit and the cost of a primary care visit for primary-care-treatable conditions per visit was calculated for the age groups in question[207].

Historical data were reviewed to determine the percentage of preventive and acute care visits. Rather than assume that all acute care visits could result in an emergency room visit, the project value conservatively estimates that a fraction of acute care visits results in an avoided emergency room visit. Improvements in HbA1c control were valued based on the current rate of adult diabetes in Houston[18] and the annual differential medical cost savings of controlled and uncontrolled diabetes[208]. The total value was calculated based on the expected improvement in the clinic patient population. The value of weight reduction was calculated based on the percentage of the population that is obese[18] and not currently diagnosed with diabetes[20]. Of those patients, it is expected that a 5-7% reduction in weight will reduce the risk of diabetes by 58%[21]. The annual savings[21] was applied to the number of diabetes cases avoided due to weight management for the duration of the Waiver.

Immunization rate value was based on the recommended doses administered to children by age 2[209], the cost of each dose[210], and the cost savings per dollar spent on immunizations[211]. This value was multiplied by the number of patients expected to be affected (the number of children as a percentage of the total patient population). For vaccines that require additional doses beyond age 2, the total savings were prorated for the remaining duration of the Wavier.

The value of cervical screening was based on the differential costs of treating localized lesions and cancers and treating regional and distant cancers[212]. The initial, interim and pro rata final stage costs are calculated based on the current incidence of cancer rates in Texas[213] and the reduction of invasive rates when screening occurs every two years[23]. The total value for the project was combined and distributed across measures to ensure category 3 outcome measurements comprised 5%, 10%, 15% and 20% of the project value in DY2-5. Distribution among the components was based on the weighted value of the measure.

City of Houston Department of Health and Human Services

Pass 1

Project Option - 2.6.3 Engage community health workers in an evidence-based program to increase health literacy of a targeted population.

Unique Project ID: 0937740-08.2.1

Performing Provider Name/TPI: City of Houston Department of Health and Human Services/0937740-08

Project Summary: Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas with a population of 2.1 million in 2010. HDHHS has 1,100 employees and a budget of $100,245,403. HDHHS serves the City of Houston through 44 distinct programs. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring and restaurant inspections; birth and death certificates; leadership in emergencies such as hurricanes; operates a comprehensive regional reference laboratory, provides communicable disease prevention and control services and disease surveillance and a variety of health and human services such as the Women, Infants and Children (WIC) nutrition program, senior nutrition services, family planning, oral health services and immunizations via a network of 4 health centers, 14 WIC sites and the Harris County Area Agency on Aging.

Intervention(s): This new project proposes to utilize community health workers to provide 24 sessions of essential education and assessment related to fall prevention and safety to 500 low income older adults. Based on other home visitation programs, the population is expected to be 90% Black or Hispanic. The program will also provide intervention to reduce hazards in the home to 100 of the 500 low income older adults initially recruited into the program.

Need for the Project: The risk for a fall increases exponentially with advancing age. Older adults often seek care at the ER for falls related injuries that are preventable. Preventing falls requires a multifactorial approach with assessment and management. This program will provide education, evaluation/assessment and fall-related hazard mitigation at home and follow up by identifying hazards that impair safety and health in the home as part of an evidence-based fall prevention intervention.

Target Population: The project will target older adults aged 60 and referrals and recruitment to this program will be generated by home visitation programs of the performing provider or its partners such as Harris County Area Aging Agency (HCAAA), Houston Department of Health &Human Services (HDHHS)Tuberculosis (TB) Control and other department programs (Communicable Diseases, etc.).

Category 1 or 2 expected patient benefits: Increase access to health promotion programs and activities using innovative program by 5% by DY4 and by 10% by DY5 over baseline numbers.

Category 3 outcomes: **IT-9.4:** (ED appropriate utilization) Reduce by 5% each the number of ED visits among program participants and number of 911 calls made for falls in older adults 60 years and over from specific zip codes over baseline in DY4 and by 10% over baseline in DY5.

Project Option - 2.6.3 Engage community health workers in an evidence-based program to increase health literacy of a targeted population: Healthy Homes Fall Prevention Initiative
Unique Project ID:0937740-08.2.1
Performing Provider Name/TPI: City of Houston Department of Health and Human Services / 0937740-08
Project Description:
The Healthy Homes Fall Prevention (HHFP) project proposes to utilize community health workers to provide essential education related to fall prevention and safety as critical components to the health and well-being of older adults (60+ years) in the community and prevent unnecessary ER usage for preventable falls in the home.
This initiative will follow a three-pronged approach: education, evaluation/assessment and follow up. This initiative will engage community health workers in an evidence-based program to increase health literacy of a targeted population. One innovative aspect of the initiative is follow-up home visiting for referrals generated by programs that already visit homes of older adults in specific high-risk zip codes that have a disproportionately high number of ER visits for falls.. Through partnerships with other Houston Department of Health and Human Services (HDHHS) programs, at-risk older adults will be identified and enrolled in the HHFP Initiative.
Issues addressed by the Safe and Healthy Homes concept are critical to the ability of seniors to age safely in place and to enjoy improved quality of life. Educating older adults on the principles of healthy homes will promote reduction of hazards in the home environment; reduce emergency room visits and reduce costs of rehabilitation. Additionally, education will be provided for home care givers to help reinforce the principles of healthy homes.
Many older adults seek care at the ER several times a year for fall related injuries. Preventing falls requires a multifactorial approach with assessment and management (CDC, 2012). The HHFP program proposes to utilize an evidence based approach of home hazard assessment and education for reducing the risk of falling. The average cost of emergency room visit for adults (aged 50-85 years) due to unintentional falls in the US, is estimated to be $3323 per visit. This is inclusive of Medical Cost and Work Loss Cost. [1]
The project will target 500 older adults aged 60 and over and provide education on the value of a safe and healthy home by identifying hazards that impair safety and health in the home, per year. Program staff will also perform 100 home inspection interventions to evaluate safety in the home, perform needs assessments, conduct periodic follow up inspections, facilitate limited remediation and refer seniors to other support programs to reduce hazards, per year.
1... Centers for Disease Control. Fall Risks in Older Adults. http://www.cdc.gov/features/fallrisks/. Accessed on 11/5/12.
The referrals to HHFP will be generated through currently existing programs such as Harris County Area Aging Agency (HCAAA), the Houston Fire Department(HFD)/Emergency Medical Team (EMT), Houston Department of Health &Human Services (HDHHS)Tuberculosis (TB) Control and other departmental(Communicable Diseases, etc.) home visiting programs.

Goals and Relationship to Regional Goals:
Project Goals:
The primary goal of this program is to prevent fall related accidents that result in Emergency Room (ER) visits
- Educate older adults on principles of Healthy Homes
- Reduce environmental hazards in the home

- Prevent fall related accidents that result in Emergency Room (ER) visits
- Reduce 9-1-1 calls to the Houston Fire Department

This project meets the following regional goal by implementing an education and follow-up model that prevents falls and potential unnecessary emergency room visits for older adults:

- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system.[1,2]

Challenges:

Some of the challenges anticipated with implementation of this initiative include difficulty in gaining trust of older adults and convincing them to modify behaviors that lead to poor health outcomes. The project will build upon relationships already established by referring program staff and use evidence based models that will lead to behavior modification.

5-Year Expected Outcome for Provider and Patients:

The performing provider expects a reduction in the number of ER visits and calls to EMT for preventable injuries (e.g., falls)

Starting Point/Baseline:

In 2010, the overall rate of nonfatal fall injury episodes for which a health-care professional was contacted was 43 per 1000 persons. Persons aged > 75 years had the highest rate (115 per 1000 persons). Because this is a new initiative, a new baseline for the population that is the target of this project will be established in Year 3 in order to determine improvements and project effectiveness in subsequent years.

1. Stakeholder input from RHP 3Working Group Members throughout the Region (including providers, consumers, hospital and clinic administrators, government officials, researchers, and advocacy groups)
2. The State of Health – Houston and Harris County, 2012.

Rationale:

The average cost of emergency room visit for adults (aged 50-85 years) due to unintentional falls in the US, is estimated to be $3323 per visit. This is inclusive of Medical Cost and Work Loss Cost. With an estimated 350 high risk individuals enrolled by the HHFP program, assuming that the program could prevent even one ER visit per year/person for unintentional falls in our enrolled population, the cost savings to the ER and the Health care system is $1,163,050 per year. Nationally, falls account for 52.4% of unintentional injuries (HCUP, 2012). In Texas, 46.7% of unintentional injuries were due to falls (Healthcare Cost and Utilization Project, 2012)[1].

Risk for suffering a serious fall related injury increases exponentially with advancing age. Nationally, approximately one third of elderly adults experienced a fall (Hausdorff et al., 2001)[2] each year. Older adults comprise a large number of ER visits due to falls. Even more disconcerting is the fact that there has been a sharp year to year increase in the number of fatal falls in older adults in the past 10 years. Many older adults seek care at the ER several times a year for fall related injuries. Preventing falls requires a multifactorial approach with assessment and management (Centers for Disease Control, 2012)[3]. The HHFP program proposes to utilize one such evidence based approach of home hazard assessment and education for reducing the risk of falling.

In 2010, the overall rate of nonfatal fall injury episodes for which a health-care professional was contacted was 43 per 1,000 population. Persons aged ≥75 years had the highest rate (115 per 1000).[3] . The direct medical costs for fall related injuries nationally is about $20 billion annually and is expected to increase substantially over the next decade as the population ages .

Project Components: There are no required project components for the project option.

The Healthy Homes project will put in place a Quality Improvement process that will continuously evaluate and improve processes for improvement. This is particularly necessary since this is a new program and there will be need to clarify procedures, revise protocols, and additional training of staff. The goal of continuous quality improvement is to establish a cyclical, continuous process of planning, assessing, monitoring, analyzing, measuring and evaluating performance to improve desired outcomes. A Plan-Do-Study-Act cycle with an initial intervention implementation on a small number of target population members and gradually scaling up to greater numbers is an essential component of this methodology. This will enable this program to recognize successes and failures early in program implementation and correct them as necessary.

Unique community need identification numbers the project addresses:

The Healthy Homes Initiative also addresses the issues addressed in the following community needs assessments:

- CN.8 High rates of inappropriate emergency department utilization[1,2]
- CN.23 Lack of patient navigation, patient and family education and information programs.[1,2]

1. Healthcare Cost and Utilization Project (HCUP), 2012. Emergency Department Data Evaluation.Report # 2005-02.US Department of Health and Human Services.Agency for Healthcare Research and Quality.From http://www.hcup.us.ahrq.gov/nedsoverview.jsp.Accessed on 7/29/12.

2. Hausdorff JM, Rios DA, Edelberg, HK. Gait variability and fall risk in community-living older adults: a 1 year prospective study. Arch Phys Med Rehabil; 82: 1050-6.

3. WISQARSTM Web-based Injury Statistics Query and Reporting System).From www.cdc.gov/ncipc/wisqars/, Accessed on 7/29/12.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

The project is a new innovation which provides services in the home to reduce falls and potential ambulance transports and emergency room visits.

Related Category 3 Outcome Measures:

OD- 9 – Right Care, Right Setting

IT-9.4 Milestone: Other Outcome Improvement Target (ED appropriate utilization – Stand-alone measure)

- Reduce ED visits related to falls in home settings(including ACSC)
- Metric: Number of 911 Calls for falls among adults age 60 and older from specific zip codes during measurement period

- Metric: Number of ED visits for falls among adults age 60 and older from specific zip codes during measurement period

Reasons/rational for the selecting the outcome measures:

We chose the “Other Outcome Improvement Measure” as our outcome because of the prevalence of falls among older adults due to structural conditions in the home that are preventable and remediable. According to the United States Preventive Task Force recommendations, decreasing the incidence of falls would also improve the socialization and functioning of older adults who have previously fallen and fear falling again http://www.uspreventiveservicestaskforce.org/uspstf11/fallsprevention/fallsprevrs.htm. The burden of falls on patients and the health care system is large. Decreasing the incidence of falls would also improve the socialization and functioning of older adults who have previously fallen and fear falling again. Many other interventions could potentially be useful to prevent falls, but because of the heterogeneity in the target patient population, multiplicity of predisposing factors, and additive or synergistic nature, their effectiveness is not known. Despite this, a cost effective solution to avoid falls in older adults and the subsequent inappropriate usage of ER, a comprehensive Fall Prevention intervention in high risk communities is relatively easy to implement.

Relationship to Other Projects and Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region’s healthcare system.

Healthcare treatment cannot focus to only the acute or chronic encounter and properly treat the patient. It is critical that our region focuses to patient education and community education to ensure a proactive and responsive approach to healthcare needs. The education models represented in the Region 3 RHP plan can be identified in the Initiative Grid (addendum) and all focus to outcome measures such as appropriate utilization, patient satisfaction scores, and standalone chronic condition scores such as diabetes and asthma.

Project Valuation:

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration, and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.
Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control

Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.

HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The Healthy Homes Fall Prevention project received a composite Prioritization score of 5.4 and a Public Health Impact score of 6.

Project Option 2.9.1 - Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care

Unique Project ID: 0937740-08.2.2

Performing Provider Name/TPI: Houston Department of Health &Human Services/0937740-08

Project Summary: Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas with a population of 2.1 million in 2010. HDHHS has 1,100 employees and a budget of $100,245,403. HDHHS serves the City of Houston through 44 distinct programs. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring and restaurant inspections; birth and death certificates; leadership in emergencies such as hurricanes; operates a comprehensive regional reference laboratory, provides communicable disease prevention and control services and disease surveillance and a variety of health and human services such as the Women, Infants and Children (WIC) nutrition program, senior nutrition services, family planning, oral health services and immunizations via a network of 4 health centers, 14 WIC sites and the Harris County Area Agency on Aging.

Intervention(s): Care Houston Links is a new program that will provide care coordination to reduce the frequency of non-urgent ambulance runs and ER visits and link 911 callers to appropriate primary and preventive care in lieu of unnecessary emergency room care. The new program builds upon the lessons learned from a predecessor program, Care Houston, that provided follow-up for frequent 911 callers. Care Houston Links will provide follow-up, education, navigation and case management to all clients with non-emergent conditions who are referred from ETHAN, the new EMS telehealth program. The project will provide new services to assure that patients referred from ETHAN are linked with a medical home.

Need for the Project: There are over 100,000 non-emergency transports made by Houston Fire Department (HFD) with certain zip codes having a high percentage of 911 calls. Data from HFD shows that 80% of the transports were non-emergency related.

Target Population: All individuals that utilize Emergency Room (ER) for non-emergent, primary care needs and are transported by ambulance to the ER, will benefit from this project. 60% of the Care Houston program clients were Medicaid clients and 15% uninsured; 60% were African Americans, 30%-Hispanic and 8% white .

Category 1 or 2 expected patient benefits: Our DY 4 goal is to improve by 5% in DY4 and 10% over baseline numbers in DY5 the number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services, and enrolled in the program.

Category 3 outcomes:

IT-9.4: Other Improvement Target (ED Appropriate utilization for those needing non-emergent care and transported by ambulance and enrolled in this program). Our goal is to reduce by 5% below baseline the proportion of non-emergent ED visits (arrived by ambulance transportation) in DY4 and 7% below baseline in DY5 among those enrolled in the program.

Project Option 2.9.1 - Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care: Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.
Unique Project ID:0937740-08.2.2
Performing Provider Name/TPI: City of Houston Department of Health and Human Services/0937740-08

Project Description:
CareHouston Links proposes to provide care coordination that will reduce the frequency of non-urgent ambulance runs and ER visits and link 911 callers to appropriate primary and preventive care in lieu of unnecessary emergency room care.

CareHouston Links is an expansion of the CareHouston program that was launched as a partnership between the Houston Department of Health Human Services (HDHHS) and the Houston Fire Department (HFD) Emergency Medical Services in 2006. CareHouston Links will expand the existing program throughout the City of Houston and integrate its services with the HFD Emergency TeleHealth and Navigation (ETHAN) Program. CareHouston Links will provide case management support to ensure clients who were referred by the ETHAN program receive appropriate follow up care and are linked to a medical home. The CareHouston Links navigators will follow up with the patient to determine if the patient followed the advice provided by the ETHAN physician. The counselor/case manager will work with the client/family and their health care provider to ensure continued compliance. In situations where the client failed to follow the advice provided, the counselor will determine and record what actually occurred and the reasons why the advice was not carried out. The counselor will assess these issues and develop a care plan to address them and ensure clients are linked to the appropriate care. Additionally, the CareHouston Links program would continue the education and referral services that were provided to frequent 911 callers through the CareHouston program.

CareHouston Links is designed to address the challenges that are faced by the City of Houston in providing emergency health services to the residents of the City of Houston. According to a report from 2008, from University of Texas School of Public Health, visits to the ER were rising due to primary care cost rising. In 2008, 10.8% of all primary care related ED visits arrived by ambulance transport and 20.9% of all other ED visits arrived by ambulance.Current data shows that there are over 100,000 non-emergency transports made by HFD. HFD has also documented certain zip-codes that have a high percentage of 911 calls. The CareHouston Links project addresses these challenges by expanding a program that has proven to reduce repeat calls to 911 and thereby reducing the use of expensive emergency services through the use of face to face follow-up, education and navigation services. The new program will build upon these past successes and not only reduce 911 calls and ambulance runs but also link callers with primary care resources as an alternative to use of expensive emergency services The zip codes that generate a large volume of 911 calls that are non-emergent will be a primary target for this program. These zip codes will be identified by the Houston Fire Department and Emergency Medical Services data system for the previous year. The pilot was conducted in 77051 and 77033 which comprise the Sunnyside neighborhood in Houston .The methods were validated for two pilot zip codes.

Goals and Relationship to Regional Goals:
The goal of this project is to utilize community health workers, case managers, or other types of health care professionals as patient navigators to provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients. These patient navigators will help and support these patients to navigate through the continuum of health care services. Patient Navigators will ensure that CareHouston Links patients receive coordinated, timely, and site-appropriate health care services and will assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the Emergency Department to site-appropriate locations.
Project Goals:

1. Expand CareHouston program to other targeted low income, underserved high risk communities and partner with the ETHAN (Telehealth) Program.
2. Enhance service to the community by reducing inappropriate emergency room visits
3. Increase the number of clients appropriately linked to a medical home
4. Increase the number of clients consistently using their medical home
5. Reduce the need for hospitalizations and improve the quality of life of clients.

This project meets the following regional goals:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system

Challenges:
The performing provider anticipates challenges in educating patients and families to use the program, working with Houston Fire Department and other EMS/Ambulance Services to meet alternative transportation needs of clients and overcoming barriers (such as appointment wait times) to link patients to a medical home. Additionally, the provider anticipates system capacity challenges that may be encountered by clients in follow-up on referrals for other needed services. The provider will seek to form ongoing working partnership with others providers of health care and social services to develop workable solutions to anticipated barriers.

5 Year Expected Outcome for Provider and Patient:
The CareHouston Links Program expects to reduce the number of ER visits and 911 calls to EMS for non-emergencies in high volume zip codes and thereby reduce costs to the health care system. The program also expects that patients will be linked to medical homes and be appropriately educated and supported to access services in the right setting.

Starting Point/ Baseline:
The number of referrals to CareHouston program in YR 2 will be used as an initial baseline for the program.

Rationale:

The CareHouston Links project will utilize health care workers, case managers/workers or other types of health professionals needed to engage with patients in a culturally and linguistically appropriate manner which is essential to guiding patients through integrated health care delivery systems. Patient navigators help patients and their families navigate the fragmented maze of doctors' offices, clinics, hospitals, out-patient centers, payment systems, support organizations and other components of the healthcare system. Referrals are made to social services, home health care services, FQHCs and other medical homes, as indicated. Additional follow-up in the CareHouston Links program would include home visits and patient education that would ensure that the clients are linked to appropriate services. Other assistance would include referrals to private ambulance services and Harris County rides to avoid inappropriate use of EMS and provide care coordination. Linking, assessing and referring clients to appropriate services will reduce their need to use 9-1-1 services. This program will facilitate communication among patients, family members, survivors and healthcare providers; coordinate care among providers; arrange financial support and assisting with paperwork; arrange transportation and child care; ensure that appropriate medical records are available at medical appointments; facilitate follow-up appointments and conduct community outreach and build partnership with local agencies and groups.

Cost savings from this program include savings related to reduction in ED use and redirecting and connecting patients to medical homes and services for chronic care management and reduction in EMS transports. The target group for this project are residents who access emergency services for circumstances that would be more appropriately addressed through alternative systems of care. Annually, the HFD makes over 100,000 transports for non-emergency reasons. The results from the currently ongoing CareHouston program are a robust indicator that patient navigation services are a viable solution to the challenge of assuring that residents access primary and preventive services in lieu of emergency services where appropriate. The challenge that led to the development of the CareHouston program was the observation by HFD EMS personnel that they were making frequent ambulance runs to the same addresses and seeing no long term solution to the client's health issues. The medical director of Houston's EMS services, who also serves as the Public Health Authority, was familiar efforts by the HDHHS to assess and meet health and social service with targeted outreach initiatives in the community. To document the challenge and the effectiveness of the intervention, HFD reviewed data from April 1, 2006-June 30, 2006 for the targeted pilot area, the Sunnyside community and found that 18 patients accounted for 113 EMS responses via 9-1-1 during this period. These patients were referred to the HDHHS and were contacted in the first part of July. These same patients were reevaluated for 911 service requests at the end of September. Following contact by HDHHS personnel, the 18 addresses/patients (including several who declined participation in the program), accounted for only 33 responses, a decrease of 70.80%. Eight of the 18 study patients, approximately 40% of the identified patients, had no requests for 911 services. Through the CareHouston program, frequent 911 callers identified by HFD are referred to HDHHS for follow-up by HDHHS navigators and case managers. Clients are assessed to determine underlying problems such as lack of education regarding health condition or transportation needs. HDHHS staff educates residents and families about their health and medical condition, the proper use of the EMS system, alternate transportation services and any other unmet needs. Referrals are made to social services, home health care services and medical homes, as indicated. The program is staffed by counselors, navigators and public health nurses who reach out to the individuals referred through phone, mail, home visits or the HFD/EMS Services.

Project Components:

CareHoustonLinks program will address all of the following project components defined for the project option 2.9.1 to establish/expand a patient care navigation program.

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency. The program will provide appropriate training and education to patient navigators so that they are equipped to address the needs of multiple racial/ethnic and socio-economically diverse populace of Houston.

b) Deploy innovative health care personnel, such as community health workers and other types of health professionals as patient navigators. The program will have a strong community base component so that there is greater buy in from the target communities.

c) Connect patients to primary and preventive care. The patient navigators will be skilled in connecting patients to primary care and will follow up to ensure that patients are making the primary care visits.

d) Increase access to care management and/or chronic care management ,including education in chronic disease self-management. Since many of the patients that will be enrolled in the program are expected to have multiple chronic conditions, navigators will connect them to disease self-management programs that currently exist in the community.

e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

The performing provider will utilize trained health care navigators to identify ED users, increase access to care management and education programs, reduce ED use and non-emergency ambulance runs and connect patients to primary and preventive care. HDHHS will build upon the experience and success of the CareHouston program to implement the CareHouston Links program. Additionally, HDHHS will conduct quality improvement activities for the project as described in the RHP planning protocol.

The performing provider will also institute a Plan-Do-Study-Act cycle in place. This will address Quality Improvement (QI) on a consistent basis. The study protocol, processes and staff training will be tested as a pilot in DY3. The goal of continuous quality improvement is to establish a cyclical, continuous process of planning, assessing, monitoring, analyzing, measuring and evaluating performance to improve desired outcomes. Thorough documentation of processes will ensure followup for quality improvement. This will give the program an opportunity to make modifications and improvements as needed by the time the outcomes (Improvement Targets) are beginning to be tracked in DY4-5. The QI process will happen on a continual basis.

Unique community need identification numbers the project addresses:

- CN-8 High rates of inappropriate emergency department utilization
- CN-20 Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs
- CN-23 Lack of patient navigation, patient and family education and information programs.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

The existing CareHouston program has been reprogrammed as CareHouston Links. The program will be expanded to include the following: 1) addition of patient care teams to expand the number of patients that can be seen in the program 2) an increase in referrals to the program to include not only frequent 911 callers but also callers that were determined through the telehealth program to need an alternative form of care other than emergency room care 3) a more robust follow-up program to not only make referrals to medical homes but also provide actual navigation support and follow-up to connect clients to medical homes and to assure usage 4) an increase in the number of 911 callers referred to the program by changing the criteria for inclusion in the program.

Related Category 3 Outcome Measures:

OD- 9 Right Care, Right Setting

IT-9.4Other Outcome Improvement Target (ED appropriate utilization due to enrollment in CareHouston Links Program)

- Rate of Non Emergent 911 callers referred to CareHouston Links

Reasons/rationale for selecting the outcome measures:

We chose the above outcome measure because it will allow us to track the tangible benefits of implementation of CareHouston Links. Since the CareHouston program's implementation in 2006, the HFD EMS unit has experienced a 72% decrease in 911 calls from specific geographic areas allowing them to redirect more than $4.6 million to other services.

By expanding to other targeted low income, underserved high risk communities, with a large volume of 911 calls, the program could expand HDHHS's capacity to connect and link clients to needed services in a timely manner and further reduce costs associated with non-emergency EMS transports and inappropriate ER visits .Linking, assessing and referring clients to appropriate services will reduce their need to use 911 services. Each time an ambulance service is dispatched to transport patients; the cost is approximately $1470. During Fiscal Year 2012, the Care Houston program diverted 1,458 clients from using EMS transports to emergency departments for non-emergencies, diverting costs of $2,143,260.

Relationship to Other Projects and Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

The ability to properly identify and monitor specific patients with chronic conditions or frequent emergency department utilization trends will allow the region to accurately mange the very large patient base. Patient navigation includes a comprehensive list of tasks as well as unique provider types based on the focus of the initiative and will help the focus of cost containment, emergency department utilization, and chronic disease management. The Region 3 Initiative Grid in the addendum allows for a cross reference of all initiatives proposed within this concept.

Project valuation:

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served/Project Size, 3) Alignment with Community Needs 4)Cost Avoidance,5) Partnership Collaboration, and 6)Sustainability. Each factor was then given a weighted score and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services, and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.
HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The CareHouston Links Program received a composite Prioritization score of 7.15 and a Public Health Impact score of 7.

Project Option - Project Option 2.9.1- Establish/Expand a Patient Care Navigation Program
Unique Project ID: 0937740-08.2.3
Performing Provider Name/TPI: Houston Department of Health and Human Services/0937740-08
Project Summary: Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas with a population of 2.1 million in 2010. HDHHS has 1,100 employees and a budget of $100,245,403. HDHHS serves the City of Houston through 44 distinct programs. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring and restaurant inspections; birth and death certificates; leadership in emergencies such as hurricanes; operates a comprehensive regional reference laboratory, provides communicable disease prevention and control services and disease surveillance and a variety of health and human services such as the Women, Infants and Children (WIC) nutrition program, senior nutrition services, family planning, oral health services and immunizations via a network of 4 health centers, 14 WIC sites and the Harris County Area Agency on Aging.
Intervention(s): This expansion project will use patient navigators to connect 300 new at risk HIV diagnosed individuals to appropriate care. Linkage to care will consist of active referrals to primary medical care, mental health, substance abuse, support services, and services for basic needs such as food and housing. Utilizing a Community-Based (Non-Medical) Case Management model, this program will also identify frequent ED utilizers and use navigators as part of a preventable ED reduction program. This project will support HIV patients through the continuum of health care.

Need for the Project: Newly diagnosed HIV patients are frequently at risk for receiving fragmented care because of being disconnected from the health care system. . The race/ethnicity of patients in HIV linkage program last year were 68% African American, 29% Hispanic and 3% White. The current service linkage program is funded through Ryan White. The Houston Area rate for enrolling newly diagnosed individuals into care falls below the average for Texas as a whole (68.6 percent) as well as the national target (85.0 percent). HIV related hospitalizations account for a significant portion of health care costs every year. Many of these visits occur when patients are not receiving continuous care to manage their infections. This expansion enhances HDHHS' ability to increase the number patients who are linked to clinical care, increase the number of patients receiving continuous clinical care and thereby reduce the number of HIV related hospitalizations which will result in significant cost savings.

Target Population: Newly diagnosed HIV patients are the target group for this project. Particular targets are high risk groups such as males, African Americans and injection drug users who are known to have lower service linkage rates than the average for the Houston region.

Category 1 or 2 expected patient benefits: Increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services by 5% over baseline in DY4 and by 10% over baseline in DY5.

Category 3 outcomes: **IT-9.4:** (ED appropriate utilization) Reduce by 5% each the number of ED visits among program participants and number of 911 calls made for falls in older adults 60 years and over from specific zip codes over baseline in DY4 and by 10% over baseline in DY5.

Project Option 2.9.1- Establish/Expand a Patient Care Navigation Program: HIV Service Linkage Expansion Program

Unique Project ID: 0937740-08.2.3
Performing Provider Name/TOI: City of Houston Department of Health and Human Services / 0937740-08

Project Description:

This Program will expand service linkage to provide navigation services to targeted patients with HIV who are at high risk of disconnect from institutionalized health care.

This project will use patient navigators to connect at risk HIV diagnosed individuals to appropriate care. Linkage to care will consist of active referrals to primary medical care, mental health, substance abuse, support services, and services for basic needs such as food and housing. Utilizing a Community-Based (Non-Medical) Case Management model, this program will also Identify frequent ED utilizers and use navigators as part of a preventable ED reduction program.

The Houston Area has placed a high priority on ensuring early linkage into HIV clinical care and treatment for those newly diagnosed through widespread HIV testing and awareness efforts. For example, a unique local service category within the Ryan White HIV/AIDS Program for linking the newly diagnosed into HIV clinical care (e.g., Service Linkage Workers) was created in 2008. Current estimates of those linked to care in the Houston Area are as follows:

1. Of newly diagnosed HIV infected individuals diagnosed in the Houston Area, 65.1 percent linked to HIV clinical care within the national standard of three months following diagnosis. The Houston area rate falls below the average for the state of Texas as a whole (68.6 percent) as well as the national target (85.0 percent).
2. Certain demographic groups in the Houston Area have lower than community-wide aggregate linkage to care rates. Known at risk groups such as males, blacks/African Americans, and Injection drug users (IDU) all have linkage to care rates below the Houston area average. Those in the age category of 13 to 24 years also have a lower than average linkage to care rate.

The Houston Area has adapted the Case Management (Non-Medical) service category for the purpose of linking the newly-diagnosed into primary HIV medical care. Defined locally as Community-Based (Non-Medical) Case Management, services provided under this adapted category are called Service Linkage. Service Linkage Workers (SLW) or patient navigators are often co-located at HIV testing sites.

The Houston area places a high priority on widespread access to HIV testing in both targeted and routine settings, using all available technologies. The Expanded Testing Initiative (ETI) supports routine opt-out HIV screening at local emergency rooms; and community-based organizations provide targeted counseling and testing to those at high risk. Of all publicly-funded HIV tests offered in the Houston Area in 2010, 1.2 percent were positive, which translates into almost 600 HIV+ individuals who became aware of their status in that year alone.The Ryan White HIV/AIDS Program Part A contracts with the HDHHS to place service linkage workers at HDHHS locations where individuals are newly-diagnosed, including routine HIV testing sites at

local emergency rooms and medical institutions and public STD clinics, for the purpose of linking these individuals to HIV care, treatment, and support services. The Service Linkage Worker Outcome Measure requires each newly-diagnosed client to be linked to a Ryan White HIV/AIDS Program-funded primary medical care or case management provider within 120 days of contact.

This Performing provider currently serves 300 HIV patients that are at or below 300% of Poverty Level. This program will expand the current linkage program to serve 300 additional new HIV patients who do not meet eligibility requirements for Ryan White funding (i.e. at or below 300% of poverty and non- Medicaid eligible) or who cannot be served by Ryan White funding because service capacity has been exceeded.

The Houston Department of Health and Human Services (HDHHS) is funded by the Ryan White HIV/AIDS Program to employ Service Linkage Workers (SLW) who connect newly-diagnosed individuals to Ryan White HIV/AIDS Program-funded primary HIV medical care. SLWs at the HDHHS are also cross-trained in disease investigation and can provide partner services for the newly-diagnosed. SLWs also provide referrals to non-HIV related services such as those for co-morbid conditions, behavioral health concerns, and social support services including housing, food, employment, transportation, and child care.

The performing provider will also institute a Plan-Do-Study-Act cycle in place for this expansion program. This will address Quality Improvement (QI) on a consistent basis. The goal of continuous quality improvement is to establish a cyclical, continuous process of planning, assessing, monitoring, analyzing, measuring and evaluating performance to improve desired outcomes. The study protocol, processes and staff training will be tested as a pilot in DY3. Thorough documentation of processes will ensure followup for quality improvement. This will give the program an opportunity to make modifications and improvements as needed by the time the outcomes (Improvement Targets) are beginning to be tracked in DY4-5. The QI process will happen on a continual basis.

Goals and Relationship to Regional Goals

The goal of this project is to utilize patient navigators (called Service linkage workers) to provide targeted, non-medical community-based case management, including active referrals to primary medical care, mental health, substance abuse, support services, and services for basic needs such as food and housing for newly diagnosed HIV patients in a geographic area with low rates of linkage to care for the target population.

Project Goals:

The overall goal of the project is to help and support HIV patients through the continuum of health care services so that patients can receive coordinated, timely services when needed with smooth transitions between health care settings. The project will expand access to the existing care management program for individuals who are HIV positive.

This project meets the following regional goals:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.

- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system,

Challenges

The program anticipates some challenges in implementation of the program. Some of these challenges are successful hiring and training of new staff for the program, maintaining ongoing collaboration with primary care providers and ensuring clients have access to immediate medical care when necessary to avoid hospitalization and developing a system that will ensure ongoing retention into care after the required time allotted to Service Linkage workers has expired. These challenges will be met by ongoing training and workforce development efforts. Additionally a strong follow up component will be added to the project so that referrals are followed up and receive appropriate care.

5- Year Expected Outcome for Provider and Patients:

Goals from the Joint Comprehensive Plan:

1. Target linkage to care efforts to vulnerable points in the HIV system (e.g., at initial diagnosis, before the first medical visit, after the initial visit, etc.) where individuals are more likely to not seek care or to fall out of care, particularly *newly-diagnosed Persons living with HIV or AIDS (*PLWHA).
2. Intensify retention and engagement activities with *currently in-care* PLWHA, focusing on community education, system enhancements, and health literacy
3. Adopt strategies to re-engage *out-of-care* PLWHA and other "prior positives" to return to care

Starting Point/Baseline:

Baseline data on navigation program after implementation will be collected in Year 2 of the project.

Rationale:

HIV related hospitalizations account for a significant portion of national health care costs every year. Many of these visits occur when patients are not receiving continuous care to manage their infections. By increasing the number of newly diagnosed HIV positive patients who are linked to clinical care within three months, and increasing the number of patients who receive continuous clinical care, the number of HIV related hospitalizations can be greatly reduced, resulting in significant cost savings.

Project Components: This project will address all the components of a navigation program. Required core project components:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency. – We plan to work with hospital ED and Expanded Testing Initiative(community based testing) to assist newly diagnosed HIV patients navigate through the health care system. Our navigators (service linkage workers) will be trained in cultural competency to reflect the diverse population in Houston.

b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators. – Our navigators will use a non-medical case management model to address the needs to the patients.

c) Connecting patients to primary and preventive care - Our navigators will ensure that the patients are connected to primary and preventive care so that they are better equipped to manage their conditions with a specified time period after their diagnosis and entry into the Service Linkage Program..

d) Increase access to care management and/or chronic care management, including education in chronic disease self-management – Our navigators will also provide information and instruction on chronic disease care and self management.

e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations - Our navigation program will conduct continuous quality improvements and share lessons learned.

Unique community need identification numbers the project addresses

The HIV Service Linkage Expansion Program also addresses the issues addressed in the following community needs assessments:

- CN.11 High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease, including AIDS/HIV1,2
- CN.23 Lack of patient navigation, patient and family education and information programs.1,2

How the project represents a new initiative or significantly enhances existing delivery systems reform initiative:

This project is an expansion of an existing HIV Service Linkage program which is funded by federal dollars. The project will add additional service linkage workers to serve more HIV positive individuals who are at risk from being disconnected from the health care system.

Related Category 3 Outcome Measures:

OD- 9 Right Care, Right Setting
IT-9.4 Other Outcome Improvement (ED Appropriate Use)
Numerator: Number of HIV patients that are in Service Linkage Program that were admitted to a hospital in the past 6 months.
Denominator: Total number of HIV patients enrolled in Service Linkage Program during the same time period.
Data Source: Service Linkage Database, Patient electronic records
Reasons/rationale for selecting the outcome measures:
We chose "Other Outcome Improvement" under Outcome Domain 9 (Right Care Right Setting) due to the high ED utilization for newly diagnosed HIV patients who may suffer from multiple comorbidities. Providing navigation services to HIV patients who are at high risk of disconnect from institutionalized health care is critical to reduce ED and inpatient use for potentially

preventable admissions in HIV patients. The Houston Area has placed a high priority on ensuring early linkage into HIV clinical care and treatment for those newly diagnosed through widespread HIV testing and awareness efforts.

Relationship to Other Projects and Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

The ability to properly identify and monitor specific patients with chronic conditions or frequent emergency department utilization trends will allow the region to accurately mange the very large patient base. Patient navigation includes a comprehensive list of tasks as well as unique provider types based on the focus of the initiative and will help the focus of cost containment, emergency department utilization, and chronic disease management. The Region 3 Initiative Grid in the addendum allows for a cross reference of all initiatives proposed within this concept.

Project Valuation:

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs, 4)Cost Avoidance 5) Partnership Collaboration, and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.

HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The HIV Service Linkage Expansion received a composite Prioritization score of 6.5 and a Public Health Impact score of 6.

Project Option - 2.7.1 Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations (TB patients or suspected TB patients)

Unique Project ID: 0937740-08.2.4

Performing Provider Name/TPI: City of Houston Department of Health and Human Services/0937740-08

Project Summary: Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas with a population of 2.1 million in 2010. HDHHS has 1,100 employees and a budget of $100,245,403. HDHHS serves the City of Houston through 44 distinct programs. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring and restaurant inspections; birth and death certificates; leadership in emergencies such as hurricanes; operates a comprehensive regional reference laboratory, provides communicable disease prevention and control services and disease surveillance and a variety of health and human services such as the Women, Infants and Children (WIC) nutrition program, senior nutrition services, family planning, oral health services and immunizations via a network of 4 health centers, 14 WIC sites and the Harris County Area Agency on Aging.

Last year, a similar project with a smaller scope, utilizing just two testing modalities served 396 TB patients, of which 119 were completely uninsured. 103 of these were African Americans and 191 were White Hispanic. This project intends to serve 1316 individuals per year to improve TB outcomes.

Intervention(s): The performing provider will implement interventions to rapidly identify and treat TB to reduce TB morbidity and to shorten recovery time for TB patients, by utilizing two testing modalities (the Nucleic Amplification Test and the QuantiFERON test) and a combination INH and RPT Therapy course to meet the program goals.

Need for the Project: This project provides a community level, comprehensive evidence based care to patients that have active or latent TB, and their contacts and suspects. Currently hospitals experience a delay in properly diagnosing TB patients due to the testing methodologies currently used. The project will rapidly and accurately identify cases and provide a short term therapy that cuts down on number of days of hospital stay. According to HCUP, in 2006 TB-related hospital stays accounted for $752 million in hospital costs, and Medicaid covered 24.4 percent of all TB stays.

Target Population: The target population will be at risk vulnerable populations such as the homeless, chronically ill low income population, refugee and new immigrant population, the indigent and those without access to care or without a medical home who are routinely reported to the performing provider for active or latent TB.

Category 1 or 2 expected patient benefits: Increase the number or percent of patients in defined population receiving innovative intervention consistent with evidence-based model by 5% over baseline in DY4 and by 10% over baseline in DY5.

Category 3 outcomes: IT-4.10 Other Outcome Improvement Target: Average length of stay for patients diagnosed with TB. Decrease average length of stay by 2% in DY4 and by 5% over baseline in DY5.

Project Option - 2.7.1 Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations: Tuberculosis Rapid Identification, Treatment and Recovery Project

Unique Project ID: 0937740-08.2.4
Performing Provider Name/TPI: City of Houston Department of Health and Human Services /0937740-08
Project Description:

The **Tuberculosis Rapid Identification, Treatment and Recovery Project** proposes to utilize three modalities of testing and treatment to reduce Tuberculosis morbidity in Houston. The three modalities are 1) Nucleic Acid Amplification Test for rapid identification of cases 2) QuantiFERON test for greater accuracy in identification of TB and 3) Combination INH and RPT Therapy for reducing the period of treatment to a 12 week directly observed therapy (DOT) instead of the previously used 9 month INH treatment. The project will utilize nurse case managers, community outreach workers, patient navigators and other partners to implement this project in the community. The program enrollees will be recruited from the reported cases due to mandatory reporting and their contacts. Additionally, health care providers and hospitals will be another venue for recruitment.

According to World Health Organization, economically poor and vulnerable populations, cultural/ethnic minorities, migrant populations, gypsies and travelers, homeless people and substance users are all at greater risk of Tuberculosis (TB) infection and disease and are likely to have worse treatment outcomes than the general population. Their complex needs are often overlooked and they experience barriers to access routine health care.Vulnerable populations such as the homeless, chronically ill low income population, those without access to care or without a medical home face the greatest burden of morbidity from Tuberculosis (TB). Among many vulnerable groups TB can be treatable and preventable with timely and accurate diagnosis and treatment. Studies have shown about 5 to 10 percent of those with latent TB infection in the United States will develop TB disease if not treated. People with latent TB infection who have weakened immune systems, including those with HIV/AIDS or diabetes, are more likely to develop TB disease after infection. For those reasons, treatment is important (3). These potential future TB cases could be admitted to hospitals for diagnoses and treatment resulting in significant costs to the healthcare system.

United States law requires that anyone with active TB must be reported to the health department. The Health Department staff is required to work with the patient's healthcare provider and the patient to make sure that a safe and effective treatment regimen is completed. This project will expand the performing provider’s (Houston Health and Human Services) capacity to serve TB patients and contacts, through the *addition* of trained TB outreach and nurse case management specialists. The project will proactively engage patients and providers in TB case management. This Project proposes to utilize patient navigators to rapidly identify active TB cases, infectious cases and more accurately screen contacts for TB infection, and reduce the length of treatment through the introduction of short course therapy.

Utilizing the CDC guidelines and the Texas Department of State Health Services Tuberculosis Branch standing delegation orders, the Performing Provider, Houston TB Bureau, will implement the use of 3HP in the treatment latent tuberculosis patients in order to increase patient compliance and completion of therapy and decrease the number of patient at risk for

progression to active TB disease. The project replaces the existing system (protocol) of testing to diagnose TB disease with a quicker more reliable method

The Houston TB Bureau will adopt cost-effective diagnostic and treatment approaches. Program Nurse case managers will engage in collaboration with medical providers and hospital infection control staff to recommend the use of the nucleic acid amplification test on bacteriology specimens. The nurse case managers will also provide education and consultations and will recommend for bacteriology specimens to be processed at the HDHHS laboratory.

The following sections provide additional details on the testing modalities that will be used:

Nucleic Acid Amplification Test: The use of nucleic acid amplification test (NAAT) will assist in the rapid identification of active TB disease in patients with positive bacteriology acid fast bacilli (AFB) smears within 72 hours, compared to the traditional culture that takes up to six to eight weeks. The result of this test will guide the physician's treatment plan, including the use of medications. The use of NAAT at the program level will ensure more effective contact investigation by curtailing the number of unwarranted contact investigations. Also, the use of NAAT will assist the hospitals in making the decision to move patients from more expensive isolation rooms to possible outpatient treatment. The anticipated patient length of stay at a hospital is 1-14 days; difficult cases with multiple health conditions may require up to 60 days, the average length of time for contagious TB clients to convert, as reported by the Texas Department of Infectious Disease in San Antonio.

Furthermore, outpatient treatment of tuberculosis is more cost effective since the main determinant of cost in treating TB is hospital stay. If a patient is already admitted when the diagnosis of TB is made, it may not be necessary to keep the patient in the hospital while waiting for sputum to convert to negative. Smear/culture positive patients may be discharged from the hospital as long as certain criteria are met... The Houston Health and Human Services (HDHHS)laboratory will be available to perform the NAAT on the specimens collected for rapid identification of possible TB disease.

QuantiFERON test: The use of the QuantiFERON test will provide a more accurate screening for TB infection by decreasing the number of patients with "false positive" results who would need evaluation. The QFT has been found to be more specific and sensitive than the traditional tuberculin skin test (TST). Patients identified through contact investigation (beginning with the foreign born and individuals in congregate settings) will be screened using the QFT. The implementation of QFT-G in the field will reduce the costs associated with clinic visits by individuals who are not truly positive reactor (including costs for doctor visits, chest X-rays and medications). QFT-G requires a single visit to complete the testing process for TB infection. TST requires two or more visits to complete the testing process. The initial targeted population for QFT-G test would be those who live in congregate settings; including homeless shelters and drug rehabilitation centers. As the project progresses, the use of this test can be expanded to include foreign born individuals and household contacts.

Community outreach workers in the field will perform the QuantiFERON test on persons identified as contacts to patients with active tuberculosis or suspected of having tuberculosis. The outreach staff will transport the blood specimens to the HDHHS laboratory. The HDHHS laboratory will provide results to the TB Bureau. The community outreach workers will notify the patients of the results and will coordinate medical follow up as needed.

Nurse Case Managers will communicate with providers the benefits of prescribing a new two-drug short course treatment to patients with latent tuberculosis infection. The nurse case

managers will also provide education and consultations. The short course treatment will be provided by community outreach workers in the field through directly observed therapy (DOT).

Combination INH and RPT: A new two-drug short course regimen treatment for contacts identified as needing treatment for latent TB infection (LTBI) will be used in the field. This new two-drug regimen (3HP, Isoniazid and Rifapentine) is recommended by the Centers for Disease Control and Prevention (CDC). The combination regimen of INH and RPT given as 12 weekly DOT doses is recommended as an equal alternative to 9 months of daily self-supervised INH for treating LTBI in otherwise healthy patients aged ≥12 years who have a predictive factor for greater likelihood of TB developing, which includes recent exposure to contagious TB, conversion from negative to positive on an indirect test for infection (i.e., interferon-γ release assay or tuberculin skin test), and radiographic findings of healed pulmonary TB (see Precautions). HIV-infected patients who are otherwise healthy and are not taking antiretroviral medications also are included in this category (2).

The implementation of this short course regimen (3HP) is to be provided via directly observed therapy (DOT) in the field for a course of 12-16 weeks as opposed to the traditional therapy of 9 months of Isoniazid. The 3HP will be used for treatment of LTBI to foreign born contacts, HIV-infected patients and difficult to manage contacts.

The nurse case managers will engage in collaboration with medical providers and hospital infection control staff to recommend the use of the nucleic acid amplification test on bacteriology specimens and the short course treatment (3HP). The nurse case managers will also provide education and consultations.

Target Zip Codes:

This program is city wide in Houston, Texas.

Goals and Relationship to Regional Goals:

This project seeks to utilize the NAAT, QFT and 3HP and a combination of nurse case managers and community outreach workers to provide comprehensive integrated care for TB patients, in order to reduce the number of days of hospitalization for those with TB and those with latent TB.

Project Goals:

- To accurately and rapidly identify and rule out TB disease.
- To work collaboratively with providers in hospitals and communities to diagnose and manage more patients with TB Through the program the performing provider will:
- Rapidly and accurately identify cases
- Partner with other healthcare providers and navigate patients to appropriate care
- To decrease the number of days a patient will need to stay in isolation room.
- To decrease the number of contacts needing medical evaluation and medications
- To Increase the number of contacts completing treatment for LTBI, thus decreasing the number of future cases.

This project meets the following regional goals:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.

Challenges:

The challenges that the performing provider expects are related to information dissemination, buy-in from patients and providers, training staff on new treatment management and testing technique, working with chosen provider who will perform an increased volume of laboratory

testing, training in phlebotomy techniques, and finally effectively promoting the program. Continuous effort will be made to provide required in service and training to program staff so that they are better equipped to handle issues as they arise. The TB Bureau will utilize nurse case managers to promote the use of NAAT and 3HP among providers and hospital settings.

5-Year Expected Outcome for Provider and Patients:
The performing provider expects that the overall health outcomes will improve for those with TB (active, latent and at-risk) who are served by the program in Houston. There is cost savings to the health care system though rapid identification, reduced hospital stays, fewer medical procedures, and fewer false positives.

Starting Point/Baseline:

Baseline data will be collected during Year 2-3 of the program.

Rationale:

The implementation of QFT-G in the field will reduce the costs associated with clinic visits by individuals who are not truly positive reactor (including costs for doctor visits, chest X-rays and medications). QFT-G requires a single visit to complete the testing process for TB infection. TST requires two or more visits to complete the testing process. The initial targeted population for QFT-G test would be those who live in congregate settings; including homeless shelters and drug rehabilitation centers. As the project progresses, the use of this test can be expanded to include foreign born individuals and household contacts.

This new two-drug regimen (3HP, Isoniazid and Rifapentine) is recommended by the Centers for Disease Control and Prevention (CDC). The combination regimen of INH and RPT given as 12 weekly DOT doses is recommended as an equal alternative to 9 months of daily self-supervised INH for treating LTBI in otherwise healthy patients aged ≥12 years

Project Components:

This project option does not have any specified components. However, this project will have built in quality improvement strategies such as lessons learned, participation in continuous quality improvement and utilizing the PDSA process to make quality improvements (QI). The performing provider will refine protocol and processes by making improvements based on the initial batch of enrollment into the program. The goal of continuous quality improvement is to establish a cyclical, continuous process of planning, assessing, monitoring, analyzing, measuring and evaluating performance to improve desired outcomes. The QI activities will continue on an ongoing basis to assure that the intervention is being delivered with high integrity. Some elements of the program are new and some aspects are an expansion on existing program components and QI activities with incremental improvements will be put in place for both components.

Unique community need identification numbers the project addresses:

- CN.6 - Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly. 4,5
- CN.20 - Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, and patient education programs. 4,5

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

The project provides comprehensive care to TB patients that have active or latent TB. This project will implement a comprehensive evidence based disease prevention program by rapid testing, accurate diagnosis and reduced treatment time for patients diagnosed with TB. The project staff will be trained to approach patients in a culturally appropriate manner. Additionally, the implementation of the new short form therapy protocol is new to the management of TB disease for the program.

Related Category 3 Outcome Measures:
IT-4.10 Other Outcome Improvement Target – Reduce number of days of hospitalization of TB patients

Reasons/rationale for the selecting the outcome measures:

We selected the above outcome measure because the goal of this program is to reduce hospital stays through a comprehensive diagnosis and treatment strategy. According to HCUP, in 2006 TB-related hospital stays accounted for $752 million in hospital costs, and Medicaid covered 24.4 percent of all TB stays. Hospital stays principally for TB had an average cost of $20,100 and an average length of stay of 15 days—more than twice the cost and three times the length of the average non-maternal, non-neonatal stay (HCUP, 2008). Therefore, our outcome measures of reduced hospital admissions for TB, are appropriate because of the savings to the healthcare system.

Relationship to Other Projects and Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.
The ability to properly identify and monitor specific patients with chronic conditions or frequent emergency department utilization trends will allow the region to accurately mange the very large patient base. Patient navigation includes a comprehensive list of tasks as well as unique provider types based on the focus of the initiative and will help the focus of cost containment, emergency department utilization, and chronic disease management. The Region 3 Initiative Grid in the addendum allows for a cross reference of all initiatives proposed within this concept.

Project Valuation:

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health

Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.
HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The TB Rapid Identification, Treatment and Recovery Project received a composite Prioritization score of 7.15 and a Public Health Impact score of 7.

Project Option 2.2.6 - Expand Chronic Care Management Models "Other" project option

Unique Project ID: 0937740-08.2.5

Performing Provider Name/TPI: City of Houston Department of Health and Human Services/0937740-08

Project Summary:

Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas with a population of 2.1 million in 2010. HDHHS has 1,100 employees and a budget of $100,245,403. HDHHS serves the City of Houston through 44 distinct programs. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring and restaurant inspections; birth and death certificates; leadership in emergencies such as hurricanes; operates a comprehensive regional reference laboratory, provides communicable disease prevention and control services and disease surveillance and a variety of health and human services such as the Women, Infants and Children (WIC) nutrition program, senior nutrition services, family planning, oral health services and immunizations via a network of 4 health centers, 14 WIC sites and the Harris County Area Agency on Aging.

Intervention(s): The Diabetes Awareness and Wellness Network (DAWN) Center is a new initiative serving 400 participants (75 diagnosed diabetics, 125 with pre-diabetes glucose levels and 200 at risk for diabetes) per year from DY 3-5 The Center will provide complementary wellness programming and offer prevention and intervention services and coordination of care for those with diabetes or at risk for diabetes through enhanced education, physical activity, self-management education, hemoglobin A1C tracking and monitoring, BMI measurements, behavioral change coaching, and case management. Participants will be recruited from 3 FQHC's, County Hospital based diabetes center and one dialysis center that all serve low income Medicaid patients.

Need for the Project: Comprehensive disease management can reduce costs based on less hospitalizations, decrease in loss of productivity, decrease in absenteeism, and decrease in unemployment from disease-related disability. Diabetes patients or those at risk for diabetes receive the greatest benefit from disease management or health enhancing behaviors to lower their risks to develop diabetes. According to the Houston Hospitalizations at a Glance Report, chronic conditions accounted for 78% of all adult preventable hospitalizations in Houston, with 26% of those being related to diabetes. 22% of adult preventable hospitalizations in the Council District D where this project is targeted are diabetes-related.

Target Population: Individuals with diabetes or at risk for diabetes residing in an underserved area (Third Ward) with a high incidence of diabetes will benefit from the comprehensive wellness program.

Category 1 or 2 expected patient benefits: Increase proportion of patients with disease self-management goals in the DAWN Center by 5% over baseline in DY 4 and by 10% over baseline in DY5.

Category 3 outcomes: IT-1.10 Diabetes care: Decrease HbA1c poor control by 2% over baseline in Wellness Center enrollees in DY4 and IT-1.10 Diabetes care: Decrease HbA1c poor control by 5% over baseline in DAWN enrollees in DY5.

Project Option 2.2.6 -Expand Chronic Care Management Models "Other": DAWN Center

Unique Project ID: 0937740-08.2.5
Performing Provider Name/TPI: City of Houston Health and Human Services / 0937740-08

Project Description:
This project would establish acomprehensive, community based Diabetes Wellness Centerin an underserved community with one of the highest incidence rates of diabetes

The Diabetes Awareness and Wellness Network (DAWN) Center will provide complementary wellness programming and offer prevention and intervention services and coordination of care for those with diabetes and other chronic conditions. The process and improvement targets have been chosen based on the project goals of chronic care self-management, care transitions, self-management goal setting, and a community based coordinated system of care.The DAWN center will be located in the Third Ward community in Houston in Council District D.

The DAWN Center will consist of four distinct but interrelated components:
1) Active Living and Healthy Eating Campaign
The campaign will focus on promoting healthy lifestyles such as active living and healthy eating through policy and environmental change strategies using appropriate strategies in apreviously identified geographically targeted population. Campaigns currently exist which promote an individual's responsibility for their health; this new campaign would expand that message to promote the understanding of how environments and livability impact health and the role individuals can take to improve their health (social-ecological model).
2) Enhanced Education and Self-Management
The Enhanced Education and Self-Management Component will includes complementary wellness programming in existing facilities located in an identified geographically targeted area most at risk of debilitating chronic disease outcomes. This component incorporates evidence-based behavior supports such as Stanford's Diabetes Self-Management Program[214] and Merck's Diabetes Conversation Maps,[215]
with monitored fitness rooms and interventions, nutrition education and produce programs as well as care coordination to ensure access to and utilization of primary health care. These activities are coupled with clinical screenings and referrals, medication management coaching and telephonic follow-up to improve quality of life and reduce the incidence of hospitalization.
3) Geographically Targeted Registry Pilot
Clinical surveillance techniques have historically been used to study infectious diseases. Databases have been created to monitor HIV/STD/influenza/SARS outbreaks. Registries have now also been developed for cancer as a way to monitor incidence and determine prevalence and possible causes. As diabetes approaches epidemic proportions, there is an increasing interest in disease registries for various chronic diseases, but particularly for diabetes.

---

[214] Stanford School of Medicine. Diabetes Self-management Program. http://patienteducation.stanford.edu/programs/diabeteseng.html. Accessed: 11-07-12
[215] http://www.journeyforcontrol.com/journey_for_control/journeyforcontrol/for_educators/conversation_maps/. Accessed: 11-07-12.

The implementation of a geographically targeted registry pilot will include tracking the individual hemoglobin levels and diagnosis codes reported by clinical laboratories serving the targeted population. Collecting the hemoglobin A1C test results and compiling the results submitted would allow HDHHS to track:

1. The prevalence of diabetes among people tested in the targeted population
2. Level of control by people with diabetes within various demographic groups in the area
3. Trends for new diagnoses of diabetes in the area
4. Estimated health care costs associated with diabetes and testing. The results could also be used for conducting cost-benefit analyses for seeking research, prevention and education funding. Ultimately, results would be used to determine the best interventions for implementation for the targeted populations.

4) Care Transition

It is statistically likely that the DAWN participants will be at high risk of preventable hospitalization. DAWN will utilize the Coleman Model for Care Transition (http://www.caretransitions.org) to guide interdisciplinary work to avoid preventable hospitalizations through a liaison relationship with three hospitals that frequently serve the target population. During the four-week Care Transitions program, patients with complex care needs and family caregivers work with a “Transition Coach” and learn self-management skills that will ease their transition from hospital to home. The coach is a licensed staff person (social worker or nurse) who has received training in the Care Transitions Intervention program. This intervention is centered on four pillars: 1. Medication self-management; 2. The Personal Health Record; 3. Timely primary care/specialty care follow up; and 4. Knowledge of red flags that indicate a worsening in their condition and how to respond. The DAWN Care Transition Coach will provide family education on preventable hospitalizations and assist in training community-based resources that can assist individuals with limited family support.

Goals and Relationship to Regional Goals:

The overall goal of this program is to empower people to make lifestyle changes to stay healthy and self-manage their chronic conditions.

Project goals:

1. Promote health behavior change and improve overall quality of life
2. Reduce risk for progressive disease impacts;
3. Increase healthy disease management behaviors;
4. Build natural (individual) supports for health maintenance;
5. Monitor and assess effective intervention for subpopulations impacted by diabetes;
6. Reduce Potentially Preventable Admissions/Readmissions (PPA/PPR)

This project meets the following Regional Goals:

The DAWN Center Project also meets the regional goals:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system.

Challenges:
In developing the Active Living and Healthy Eating Campaign, two challenges that we anticipate are the development of messages that resonate with diverse community populations and the determination of the most appropriate channels of communication. To overcome these challenges we will work in partnership with a group of community based organizations that serve the diverse populations that will be utilizing the Center. We will conduct focus groups and use the results to develop messages and select appropriate channels of communication. A second challenge is the development of an electronic records system to reflect progress on behavior change program goals. This challenge will be met by meeting with other entities that have faced a similar challenge and learning from them. Two challenges anticipated through the geographically-targeted registry pilot include "getting buy-in from providers" and determining whether to make the registry mandatory or voluntary. Getting buy-in from providers will be accomplished by providing an orientation and tour for providers. Providers will then know that the DAWN Center wants to partner with them to provide services that they cannot provide and at a location that is convenient for the patient. The challenge with the registry has to do with whether or not the Center wants to provide an "opt out" option to participants. The Center staff will work with participants to assure them that the registry will allow the Center to track progress and provide alternative activities for the successful management of their diabetes. In order to make "care transition" successful, the development of liaison relationships with key hospitals and providing home-based care for clients with limited family support will be key. These challenges will be met by working with the Area Agency on Aging (AAA, housed within the Houston Health Department) in the area of training. AAA has run a similar program and has learned how to work with hospitals and clients with limited family support.

5-Year Expected Outcome for Provider and Patients:
HDHHS expects to see improved self-management of diabetes by patients served at the DAWN center. Additionally there is an expected avoidance of preventable hospital admissions for patients with diabetes who are served by the center.

Starting Point/Baseline:
Baseline data for the project will be established by the end of the first year of program implementation (DY3).

Rationale:
A review of literature (Economic Costs of Diabetes in the U.S. in 2007) indicates that a program similar to the Diabetes Awareness and Wellness Network (DAWN) Center that focuses on enhanced education, physical activity, self-management education, hemoglobin A1C tracking and monitoring, BMI measurements, behavioral change coaching, and case management can reduce costs based on less hospitalizations, decrease in loss of productivity, decrease in absenteeism, and decrease in unemployment from disease-related disability(www.ncbi.nlm.nih.gov/pubmed/18308683).

The prevalence of Diabetes in in Greater Third Ward-Macgregor-Gulfgate area of City of Houston,where the DAWN Center will be based has a high prevalence of diabetes.This area is

one of the 28 geographic units within Harris County used by Houston Health Survey 2010.[216]As per Census 2010 data, Blacks represent more than half (52.78%) of the total population residing in this area. Similarly, 35.39% of the population is Hispanics. Almost 40 % of the total population living in the area is 40 years and older.

Overall, in the U.S. diabetes prevalence rate is almost twice among Blacks and Hispanics compared to Non-Hispanic whites.[217] Similarly, educational attainment among the residents-a proxy measure of overall health of the community- is low in the proposed area. For example, percentage of residents with less than a high school degree among 25 years or older was 31 compared to 21% in Houston [(3).] Similarly percentage of residents (18 years and older) with household income less than 100% of federal poverty level in the proposed area is 39%, a higher rate compared to Houston as a whole (26%). According to Houston Health Survey (2010), the unemployment rate among adults (18 years +) was 22 %, higher than Houston average of 16%. Other indicators of health such as percentage of population reporting 7 or more days of poor physical health in the past month was higher among the residents of the proposed area compared to Houston average. Higher rates of obesity was reported in the proposed area (34%) compared to Houston average of 30%. Diabetes diagnosis was also slightly higher than the Houston average, 12 % vs. 11% respectively [(1).]

As per the Houston Health Survey (2010), described in the previous page, diabetes diagnosis in Harris County is 9.5 % among Non-Hispanic Whites, 15.2 % among Non-Hispanic Blacks, 11% among Hispanics and 5.8 % among Asians. Among all races, the prevalence is 11.1 %. Among Non-Hispanic Blacks, women have higher rates (17.3%) than the men (12%).

On the HCUP website, some "outcomes/effectiveness research" reports indicated that better adherence to diabetes medications means fewer hospitalizations and emergency department visits. The researchers used a database containing information on 5 million individuals covered by employer-sponsored health insurance and included prescription drug insurance claims, employer health plans, hospitalizations, and ED visits. The final sample consisted of 56,744 individuals with Type 2 diabetes, who required oral anti-diabetic medications to manage their condition. When adherence rates were raised from 50% to 100%, although diabetic drug costs increased substantially; for payers, this still resulted in a savings of $1.12 in hospital care for every dollar that was spent on diabetes medications. When reduced ER costs were taken into consideration, a total cost savings of $1.14 for every additional dollar spent on medications were realized.

Project Components:

This project option does not have any required core components..

However, the DAWN project will include a component to conduct systematic quality improvement for the project.

Activities will include Identifying project impacts, "lessons learned," opportunities to scale all or part of the project to a broader patient population, and key challenges associated with expansion

---

[216]Institute for Health Policy UTSPH. Health of Houston Survey. https://sph.uth.edu/research/centers/ihp/health-of-houston-survey-2010/ . 2012. 9-15-2012.

[217]Centers for Disease Control and Prevention. National diabetes fact sheet: national estimates and general information on diabetes and pre-diabetes in the United States . 2011. Atlanta, GA, U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, 2011.

of the project, including special considerations for safety-net populations. Due to the performing provider's experience and established networks in serving low income population in the County, this program will benefit from these experiences. Nevertheless, program processes will be refined and improved through a Plan-Do-Check-Act process. The goal of continuous quality improvement is to establish a cyclical, continuous process of planning, assessing, monitoring, analyzing, measuring and evaluating performance to improve desired outcomes. It is expected that revisions to the protocol, training requirements, partnership processes and expectations will need to be clarified on a regular basis. These program components will be improved through the PDSA process. Initial program enrollment of a small number of target population in DY3 will help iron out the program weaknesses and allow for a continuous improvement process.

Unique community need identification numbers the project addresses:
The DAWN Center also addresses the issues addressed in the following community needs assessments:

- CN.1 Inadequate access to primary care
- CN.8 High rates of inappropriate emergency department utilization
- CN.10 High rates of preventable hospital admissions
- CN.20 Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs
- CN.23 Lack of patient navigation, patient and family education and information programs.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
DAWN is a new initiative which places a comprehensive health and wellness center in a targeted community at risk for poor health outcomes.

<u>**Related Category 3 Outcome Measures:**</u>
OD-1 Primary Care and Chronic Disease Outcomes:
IT-1.10 Diabetes care: HbA1c poor control (>9.0%)17- NQF 0059 (Stand-alone measure)

- a Numerator: Percentage of patients 18-75 years of age with diabetes (Type 1 or Type 2) who hadhemoglobin A1c (HbA1c) control > 9.0%.
- b Denominator: Members 18 to 75 years of age as of December 31 of the measurement year withdiabetes (Type 1 and Type 2)

Reasons/rationale for the selecting the outcome measures:

We chose this Outcome Measure because the DAWN Center aims to reduce prevalence and promote management of Diabetes in a high risk area. One of the most important indicators of blood sugar control is HbA1c. Clinically healthy range for HbA1c is less than 5.7%, values between 5.7% and 6.4% are considered pre-diabetes and values higher than 6.4 are referred to as diabetes. For a diabetic patient, it is recommended to maintain the HbA1C level below 6.5-7 % [(1).] HbA1C indicates how well one is controlling the blood sugar over the last 60-90 days, which helps the patients and their care providers to adjust the diet, physical activity and medication accordingly. HbA1C is also considered as the' gateway' to care for individuals with type-2 diabetes

According to the *Houston Hospitalizations at a Glance Report,* chronic conditions accounted for 78% of all adult preventable hospitalizations in Houston, with 26% of those being

related to diabetes. This same report indicates that in Council District D, (most consistent with the targeted service area of the DAWN Center) the annual average cost of adult preventable hospitalizations for District D is $69,644,160 (the highest annual average cost for any District). Additionally, 22% of adult preventable hospitalizations in District D are diabetes-related. City Council District D has the second highest number of preventable diabetes hospitalizations (2,420). It also has the highest average cost per discharge of adult preventable hospitalizations by Council District ($32,038).
Additionally, the literature (*Economic Costs of Diabetes in the U.S. in 2007,Diabetes Care31: 596-615, 2008*) indicates that a program similar to the Diabetes Awareness and Wellness Network (DAWN) Center that focuses on enhanced education, physical activity, self-management education, hemoglobin A1C tracking and monitoring, BMI measurements, behavioral change coaching, and case management can reduce costs based on less hospitalizations, decrease in loss of productivity decrease in absenteeism, and decrease in unemployment from disease-related disability.

Relationship to Projects and Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Healthcare treatment cannot focus to only the acute or chronic encounter and properly treat the patient. It is critical that our region focuses to patient education and community education to ensure a proactive and responsive approach to healthcare needs. The education models represented in the Region 3 RHP plan can be identified in the Initiative Grid (addendum) and all focus to outcome measures such as appropriate utilization, patient satisfaction scores, and standalone chronic condition scores such as diabetes and asthma.

Project Valuation:

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration, and 6)Sustainability. Each factor was then given a weighted score and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS

scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category. HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. DAWN received a composite Prioritization score of 7.10 and a Public Health Impact score of 7.

Project Option 2.13.2 - Implement other evidence-based project to provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in an innovative manner.

Unique Project ID: 0937740-08.2.6

Performing Provider Name/TPI: City of Houston Department of Health and Human Services/0937740-08

Project Summary: Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas, the fourth largest city in the U.S., with a population of 2.1 million in 2010. Established in 1840, HDHHS has grown to a department of 1,100 employees. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring; restaurant inspections; lead paint safety; cancer screening and family planning for the uninsured; communicable disease prevention and control; disease surveillance; birth and death certificates; leadership in emergencies such as hurricanes; services to seniors; WIC programs; immunizations; and others. HDHHS operates 11 multi-service centers, 6 health centers, 14 WIC (Women, Infants and Children nutrition program) sites, the Harris County Area Agency on Aging, a comprehensive regional reference laboratory, and 44 health and human service programs. While HDHHS provides services that benefit all Houston residents, the department also takes additional steps to support those most in need, such as low income mothers and children, the elderly, and minority populations.

Intervention(s): The performing provider will implement interventions 1)Visiting Nursing and / or community health worker services; 2) Substance abuse services involve a range of services for individuals (N=8000/year) who frequently display a range of mental and physical symptoms that indicate alcohol or other substance abuse in DY4-5.

Need for the Project: The new Sobering Center initiative provides a short term inpatient and outpatient facility where individuals arrested for being under the influence of alcohol or other substances need a facility where they are under medical supervision but not utilizing valuable health care resources at other settings such as hospitals admissions or the ER.

Target Population: The target population will be individuals that have been arrested by the Police Department for alcohol or other substance abuse issues and are taken to the Sobering Center.

Category 1 or 2 expected patient benefits: 5% decrease over baseline in preventable admissions and readmissions into Criminal Justice System of those who were previously arrested for public intoxication and have participated in Sobering Center program in past 6 months in DY4 and 7% decrease over baseline in DY5.

Category 3 outcomes: IT-9.4 Other: Decrease preventable admissions to ER/ hospitals/criminal justice setting due to non-emergent alcohol/other substance use intoxication in a 6 month period by 2% over baseline in DY4 and by 4% in DY5.

Project Option 2.13.2 - Implement other evidence-based project to provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in an innovative manner: Sobering Center

Unique Project ID: 0937740-08.2.6

Performing Provider Name/TPI: City of Houston Department of Health and Human Services / 0937740-08

Project Description:

Texas's mental health system provides rehabilitative services and pharmacotherapy to people with certain severe psychiatric diagnoses and functional limitations, but can serve only a fraction of the medically indigent population. It does not serve other high risk behavioral health populations and does not provide the range of services needed to deal with complex psychiatric, addiction and physical needs. These complex populations become frequent users of local public health systems. Each year, the Houston Police Department arrests and incarcerates over 17,000 individuals for Public Intoxication. The City of Houston Sobering Center will be an alternative means of handling public inebriates rather than constantly subjecting them to placement in a an emergency room or a jail facility. The Sobering Center will offer a continuum of care using a comprehensive multidisciplinary approach for intoxicated persons brought to the Emergency Department as well as picked up by the Police Department from other public locations in the city. The Center is loosely modeled after the McMillan Stabilization Project in San Francisco and the San Diego Serial Inebriate Program. The Center will offer a range of services for individuals who frequently display a range of mental and physical symptoms that indicate alcohol addiction. The primary services that will be offered are:

1) Monitoring participants for health and safety while at the center for 4-6 hours while they sober up
2) Screening and assessment once they sober up to gather history and determine needs
3) Development of service plans based on identified needs
4) Linking participants, who agree, to treatment and detox as needed

The Sobering Center is designed to be a short-term care facility designed as a safe location for police officers to transport individuals who are under the influence or alcohol or other substances. When operating fully, the Center is expected to serve 8000 individuals /year. The Sobering Center will monitor the residents for safety because of risks of alcohol poisoning, choking on vomit, suffocating, or because they may have undetected medical conditions or serious head injuries.

Target Zip Codes:

The project will be implemented city wide.

Goals and Relationship to Regional Goals:

Project Goals:

The goal of the project is to offer a community based facility where individuals that have been in contact with law enforcement due to public intoxication or other substance use can receive services and referrals to address their needs without being transported to the ER.

This project meets the following regional goals:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.

Challenges:

One of the challenges for this project will be finding adequate resources for detoxification and effective, low to no cost treatment options for individuals who accept referral and treatment services. These challenges will be handled by developing a seamless referral and follow up process, regular inservice trainings and quality improvement checks, and an ongoing feedback process.

5-Year Expected Outcome for Provider and Patients:

The performing provider expects decrease in costs to public systems (ER, criminal justice system) related to alcohol and or other substance abuse and reduction in ER visits related to alcohol and other substances. Additionally, there should be an increase in referrals to treatment programs.

Starting Point/Baseline:

This is a new initiative. A baseline will be established in the first year of full operation (DY3).

Rationale:

Other cities adopting such sobering centers have seen reductions in arrests and jail time for these offenders, as well as fewer emergency room and hospital check-ins for this often indigent population, on top of the cost savings found in jail bed diversions. In San Antonio, in the first year alone, the sobering center led to $6 million in cost savings. After three years, total cost savings from reduced jail time, reduced hospitalizations, and other sources stretches over $25 million.

Project Components:

There are no required project components for this project. Nevertheless, since this is a new program, processes will be refined and improved through a Plan-Do-Check-Act process. The goal of continuous quality improvement is to establish a cyclical, continuous process of planning, assessing, monitoring, analyzing, measuring and evaluating performance to improve desired outcomes. It is expected that revisions to the protocol, training requirements, partnership processes and expectations will need to be clarified on a regular basis starting with the pilot implementation in DY3. These processes will be improved through the PDSA process. Initial program enrollment of a small number of target population will help iron out the program weaknesses and allow for a continuous improvement process.

Unique community need identification numbers the project addresses:

The Sobriety Center Project also addresses the issues addressed in the following community needs assessments:

- CN.6 Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly.
- CN.23 Lack of patient navigation, patient and family education and information programs.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This is a new initiative for the City of Houston. There is currently no facility similar to a Sobering center in Houston.

Related Category 3 Outcome Measures:

OD-9 Right Care, Right Setting:

IT – 9.4 Other Outcome Improvement Target (Non emergent ER visits and hospitalizations in Sobering Center Participants)
Rate: Preventable admissions to ER and hospitals due to alcohol/other substance use intoxication in Sobering Center Participants in previous 6 month period

Reasons/rational for the selecting the outcome measures:

This facility will result in cost savings to the Health Care system. There were 187,537 ER visits projected for 2012 (projected from data from Jan to June of 2012) in Harris County Hospital District of which approximately 3% were alcohol related. This means 5626 were alcohol related ER visits per year. Other cities adopting such sobering centers have not only seen reductions in arrests and jail time for these offenders, but also fewer emergency room and hospital check-ins for this often indigent population. This approach is more effective because it addresses the underlying issue of alcohol abuse inherent in most public intoxication offenses.

Relationship to Other Projects:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

The behavioral health crisis in Region 3 is considerable and the proposed initiatives in our RHP plan will only imply a small impression into the overall community need for treatment, but is a good start. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is similar to many others in the sense of the category of behavioral health. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Project Valuation:

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs, 4) Cost Avoidance, 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire

community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.
HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The Houston Sobering Center received a composite Prioritization score of 5.35 and a Public Health Impact score of 6.

Project Option 2.6.4 - Implement other evidence based project to implement health promotion programs in an innovative manner not described above.

Unique Project ID: 0937740-08.2.7

Performing Provider Name/TPI: City of Houston Department of Health and Human Services/0937740-08

Project Summary: Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas with a population of 2.1 million in 2010. HDHHS has 1,100 employees and a budget of $100,245,403. HDHHS serves the City of Houston through 44 distinct programs. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring and restaurant inspections; birth and death certificates; leadership in emergencies such as hurricanes; operates a comprehensive regional reference laboratory, provides communicable disease prevention and control services and disease surveillance and a variety of health and human services such as the Women, Infants and Children (WIC) nutrition program, senior nutrition services, family planning, oral health services and immunizations via a network of 4 health centers, 14 WIC sites and the Harris County Area Agency on Aging.

Intervention(s): The performing provider will implement interventions to provide an expansion of an evidence-based home visitation program for 100 first time mothers in an underserved area. This consists of 64 home visits over two and one half years for each client enrolled in the program with visits conducted weekly, bi-monthly and monthly.

Need for the Project: This expansion project provides a comprehensive evidence based care to underserved enrolled clients. Underserved clients would not normally have access to comprehensive services provided by such a program to improve birth outcomes for the child and health and social outcomes for the mother. Last year, the NFP served 146 clients with the home visitation program of which 66% were Medicaid clients.

Target Population: The target population will be women who live in a geographically identified area of the city who have high rates of low birth weights and low prenatal care rates. Recruitment for the program will be conducted from the performing provider's health clinics and WIC Centers.

Category 1 or 2 expected patient benefits: Increase the number or percent of patients in defined population receiving innovative intervention consistent with evidence-based model by 5% over baseline in DY4 and by 10% over baseline in DY5.

Category 3 outcomes: IT-8.2 Percentage of low birth weight babies - Reduce percentage of Low Birth- weight births by 2% in DY4 and by 4% in DY5 among women enrolled in the program. IT-8.1 Timeliness of Prenatal Care - Increase by 5% over baseline number of women that receive recommended prenatal and postnatal care in DY4 and by 10% over baseline in DY5.

Project Option 2.6.4 - Implement other evidence based project to implement health promotion programs in an innovative manner not described above.
Unique Project ID: 0937740-08.2.7

Performing Provider Name: City of Houston Department of Health and Human Services / 0937740-08

Project Description:

This project will expand the Nurse Family Partnership (NFP), an evidence-based home visitation program for first-time mothers. NFP utilizes Bachelor prepared, Registered Nurses to conduct home visits to address multiple needs of their clients.

Public health nurses are the backbone of Nurse-Family Partnership's (NFP) success. Since the program's inception, nurses have been instrumental in shaping and delivering this evidence-based, community health program. Because of their specialized knowledge and person-centered approach, the public health nurses who deliver the Nurse-Family Partnership program in their communities, establish trusted relationships with young, at-risk first time mothers. During home visits and follow-up contact, guidance is provided to address the emotional, social, and physical challenges these first-time moms face as they prepare to become parents. But most importantly, Nurse-Family Partnership Nurse Home Visitors make a measurable, long-lasting difference in the lives of their clients.

The NFP home visitation consist of 64 planned home visits over a two-and-a-half year period for each client. Home visits are conducted weekly, bi-monthly and monthly. The baby's father and other family members are encouraged to participate. Recruitment for NFP is conducted at Houston Department of Health and Human Services (HDHHS) Health Centers and WIC sites; other sources for recruitment include pregnancy testing centers, physician offices and self-referrals.

The greater Sunnyside area in Southeast Houston is the selected region for expansion of NFP services. Recent data revealed the Sunnyside area has an alarming rate of low weight births (14.7%), almost five (5) times the Healthy People 2010 goal of < 5.0 % . Approximately one out of five mothers report receiving late prenatal care. This area has a limited number of prenatal care facilities. According to Texas Department of Health and Human Services Commission, the Sunnyside area had a history of being disproportionately represented in the numbers of out of home placements related to abuse and neglectand is one of the highest in the state.

The NFP team consists of 1 Nurse Supervisor, 4 Bachelor of Science in Nursing prepared Registered Nurses and 1 administrative support person. Potential clients will be recruited from HDHHS Health and WIC sites, local high schools, area Pregnancy Centers, FQHCs, HMOs and other home visitation programs.

The visits consist of extensive prenatal, infant and childhood education. This comprehensive program expands to 2 ½ years, with visitations spanning weekly, bi-monthly and monthly. NFP currently collaborates with other programs that serve underserved families in low-income communities in Houston.

This intensive level of support has proven to improve outcomes relating to:

- Preventive health and prenatal practices for the mother – helping her find appropriate prenatal care, improve her diet, and reduce her use of tobacco, alcohol, and illegal

substances. Additionally, NFP nurses help the mother prepare emotionally for the arrival of the baby.

- Health and development education and care for both mother and child – providing individualized awareness of specific child development milestones and behaviors, as well as encouraging parents to use praise and other nonviolent techniques.
- Life coaching for the mother and her family – enabling economic self-sufficiency among mothers by encouraging them to develop a vision for their own futures, stay in school, find employment, and plan future pregnancies.

Currently, Houston Department of Health and Human Services (HDHHS) provides NPF services in the North, Northeast and Northwest regions of Houston/Harris County. There is an emphasis in the Acres Home area in North Houston, secondary to the high rates of infant low birth weight rates (lbw). Since implementation of the NFP program, the infant lbw rates have decreased.

Goals and Relationship to Regional Goals:
The goals of the NFP project is to improve birth outcomes in underserved areas by providing a comprehensive package of services to each enrolled client over a 30 month period by well trained nurse conducting home visitations.

Project Goals:
To expand the current Nurse Family Partnership Program to the Sunnyside community and:

1. Improve pregnancy outcomes
2. Improve child health and development
3. Improve economic self-sufficiency

This project meets the following regional goals:
This project will contribute to developing a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation process. NFP is an evidence-based best practice promoted and supported by a national organization. The current program funded by the department of State Health Services is a statewide effort to improve perinatal outcomes through the NFP program.

Challenges:

One of the challenges that we anticipate are securing and maintaining a nursing staff with a suitable match between nurse's professional/personal goals and program requirements. Regular meetings and feedback with program staff will be used as one of the means of identifying potential problem areas and overcoming some of these challenges. Opportunities for trainings and continuing educaton will also be offered to the project staff. The professional and personal goals of the staff will be taken into account and steps will be taken to close gaps whenever possible.

5-Year Expected Outcome for Provider and Patients:
We expect improved perinatal outcomes and improvement in indicators of child health and well-being.

Starting Point/Baseline:

Baseline data will need to be collected since the program will be expanding into a new community. Baseline data will be sought from the Department's epidemiology area as well as

from previous assessments done on the Sunnyside community. Baseline will be established in Year 2.

Rationale:

The NFP program has been implemented at multiple locations throughout the US. Extensive evaluation of the program conducted nationally utilizing data from multiple sites, indicates that NFP participation is predictive of better birth outcomes, including fewer pre-term births. According to the national Nurse Family Partnership website (www.nursefamilypartnership.org/), data from the 1990 Nurse Family Partnership (NFP) Memphis trial noted that the NFP nurse-visited families gained academic and employment skills to become economically self-sufficient. According to this analysis, NFP services resulted in lower enrollment in Medicaid and Food Stamps, with a 9% reduction in Medicaid costs and an 11% reduction in Food Stamps costs in the 10 years following the birth of the child. Federal savings were estimated at 154% of costs, yielding a net 54% return on the federal investment.

A 2005 RAND Corporation analysis found a net benefit to society of $34,148 (and that was in 2003 dollars) per higher-risk family served, with the bulk of the savings accruing to government, equating to a $5.70 return for every dollar invested in Nurse-Family Partnership. The analysis also found that for the higher-risk families participating in the first trial in Elmira, New York, the community recovered the costs of the program by the time the child reached age four, with additional savings accruing throughout the lives of both mother and child.

Using the RAND Corporation's figure of net benefit to society of $34,148 per higher-risk family served, it is anticipated that the 100 higher-risk families that will be served by this expansion of NFP into the Sunnyside area will yield a cost savings over one year of $3,414,800 (RAND Report)[218]. Using a 2007 report by NFP, a net return to government of $17,180 per NFP family served was realized. Using these figures, a more conservative cost savings of $1,718,000 would be realized.

Project Components: N/A

This project will include a component to conduct quality improvement for the project. Activities will include

- Identifying project impacts, "lessons learned" to adapt and scale the program to the local context, paying attention to possibilities of expansion to low-income, underserved areas with a high proportion of minority populations with poor birth outcomes.

By leveraging the performing provider's experience and established networks in serving low income population, this program will benefit from these experiences. Program processes will be refined and improved through a Plan-Do-Check-Act process. The goal of continuous quality improvement is to establish a cyclical, continuous process of planning, assessing, monitoring, analyzing, measuring and evaluating performance to improve desired outcomes. It is expected that revisions to the protocol, training requirements, partnership processes and expectations will need to be clarified on a regular basis. These will be improved through the PDSA process. Initial program enrollment of a small number of target population will help iron out the program weaknesses and allow for a continuous improvement process.

218 What We Know and Don't Know About the Costs and Benefits of Early Childhood Interventions. L. Karoly, P.W. Greenwood, S.S. Everingham, J. Hoube, M.R. Kilburn, C.P. Rydell, M. Sanders, and J. Chiesa. RAND Corporation, Santa Monica, CA

Unique community need identification numbers the project addresses:

The Nurse Family Partnership Expansion Project also addresses the issues addressed in the following community needs assessments:

- CN.14 High rates of poor birth outcomes and low birth-weight babies
- CN.20 Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs
- CN.23 Lack of patient navigation, patient and family education and information programs

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

The project is an expansion of HDHHS' existing Nurse Family Partnership program to a new community and to a number of pregnant women.

Related Category 3 Outcome Measures:

OD-8 NFP Outcomes:

IT-8.2 Percentage of Low Birth-Weight Births (CHIPRA/NQF # 1382)46 (Stand-alone measure)

- Numerator: The number of babies born weighing <2,500 grams at birth
- Denominator: All births
- Data source: Program Electronic Records

IT-8.1 Timeliness of Prenatal/Postnatal Care (CHIPRA Core Measure/NQF #1517) (Non-standalone measure)

- Numerator: Deliveries of live births for which women receive the following facets of prenatal and postpartum care:
- Received a prenatal care visit as a member of the organization in the first trimester or within 42 days of enrollment in the organization.
- Denominator: Deliveries of live births between November 6 of the year prior to the measurement year and November 5 of the measurement year
- Data source: Program Electronic Records

Reasons/rationale for the selecting the outcome measures:

The two outcomes selected for the NFP project are 1) Reduce Pre-term birth (born too soon) and 2) Provide timely and adequate prenatal care because of extensive evidence that improvements in these outcomes are robust indicators of positive birth outcomes.

Pre-term birth is defined as babies born alive before 37 weeks of pregnancy is completed. Being born too soon places the life of the baby in a precarious position. According to the World Health Organization, pre-term birth is the leading cause of newborn deaths (death during the first 4 weeks of life) and the second leading cause of death in children under the age of five. Many cost

effective strategies have been identified and implemented to reduce pre-term birth and produce better birth outcomes such as home visitation programs and other interventions.

Provision of timely and adequate recommended prenatal care is extremely important to improve birth outcomes in low-income women who may typically not have access to regular primary and preventive care. Prenatal care given starting the first 3 months of pregnancy can have an impact on the health of the baby as well as the mother. Access to early prenatal care By allowing women and providers to identify and address health problems and behaviors that may cause particular harm during early fetal development, first-trimester prenatal care can lead to improved outcomes, according to the US Department of Health and Human Services. Early prenatal care is likely to matter most for women who are at elevated risk of poor birth outcomes due to smoking, poor nutritional status, HIV-positive status, or other serious health problems prior to pregnancy.

Relationship to Other Projects and Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Healthcare costs are significantly increased within a patient base with such aggressive chronic conditions that have gone untreated. The initiatives focused to chronic disease management focus to conditions such as asthma, hypertension, and diabetes and are similar in the approach of managing & proactively treating chronic conditions in order to reduce 30-day readmission rates, inappropriate emergency department utilization, and healthcare costs. The Region 3 Initiative grid allows a cross reference of initiatives associated with chronic disease management. (addendum)

Project Valuation:

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that

comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.
HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. NFP received a composite Prioritization score of 6.95 and a Public Health Impact score of 7.

City of Houston Department of Health and Human Services

Pass 2

Project Option 2.7.1 Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations- Colorectal Cancer Awareness and Screening (COCAS)

Unique Project ID: 0937740-08.2.8 / Pass 2

Performing Provider Name/TPI: City of Houston Department of Health and Human Services/0937740-08

Project Summary: Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas, the fourth largest city in the U.S., with a population of 2.1 million in 2010. Established in 1840, HDHHS has grown to a department of 1,100 employees. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring; restaurant inspections; lead paint safety; cancer screening and family planning for the uninsured; communicable disease prevention and control; disease surveillance; birth and death certificates; leadership in emergencies such as hurricanes; services to seniors; WIC programs; immunizations; and others. HDHHS operates 11 multi-service centers, 4 health centers, 14 WIC (Women, Infants and Children nutrition program) sites, the Harris County Area Agency on Aging, a comprehensive regional reference laboratory, and 44 health and human service programs.

Intervention(s): The interventions for this new colorectal cancer (CRC) awareness and screening (COCAS) project are to provide CRC screening for 500 individuals/year in DY4 and 5, for each of the two target geographic areas; in twelve spatially identified, primarily African American, high risk zip codes. It will involve: 1) Awareness raising small media campaign utilizing culturally appropriate messages, 2) CRC Education about Screening Guidelines and Recommendations, 3) Access to Community wide Non-invasive FIT testing, 4) Test taking training, 5) Testing by nationally accredited laboratory, 6) Sharing of test results, communication and Follow up protocol, and 7) Patient Care Navigation for getting individuals situated in a medical home in the targeted zip codes.

Need for the Project: Screening for CRC can test for disease in early stages before symptoms occur. This can prevent morbidity and mortality due to CRC. Significant disparities exist in CRC outcomes with low income, minorities having the poorest outcomes. Screening rates for CRC by a population level, non-invasive method (FOBT) is low in Harris County. This project aims to increase screening rates through a comprehensive program in high risk zip codes.

Target Population: The target population for this project are 50-75 year old men and women (in keeping with the screening guidelines) in twelve high risk zip codes (with previously identified age adjusted spatial clusters of late stage CRC diagnosis) indicating lack of timely screening.

Category 1 or 2 expected patient benefits: Increase number of patients in defined population receiving innovative intervention consistent with evidence-based model by 5% in DY4 and by 10% in DY5.

Category 3 outcomes: IT- 12.3 Increase Colorectal Cancer Screening in target population by 2% over baseline in DY4 and by 5% over baseline in DY5. IT- 11.3 Improve by 5% over baseline utilization rates of clinical preventive services (testing, preventive services) in target population with identified disparity in DY 4 and by 10% over baseline in DY5 .

Project Option 2.7.1 Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations- The Colorectal Cancer Awareness and Screening (COCAS) project

Unique Project ID: 0937740-08.2.8 / Pass 2
Performing Provider: City of Houston Department of Health and Human Services/ 0937740-08.2.8

Project Description:
The Colorectal Cancer Awareness and Screening (COCAS) project aims to increase colorectal cancer screening rates by 5% over baseline in previously identified high risk zip codes among 50-75 year old males and females using FOBT and alleviate health disparities in CRC outcomes. Regular screening FOBT can reduce colorectal cancer deaths by 15-33% [1-3].

Community based cancer prevention interventions are categorized as one or a combination of the following: access to screening, mass media, small media, one on one and small group education, or a combination of these. The COCAS project will achieve its objectives by providing the following: 1) Awareness small media campaign utilizing culturally appropriate messages, 2) CRC Education about Screening Guidelines and Recommendations, 3) Access to Community wide Non-invasive FIT testing, 4) Test taking training, 5) Testing by nationally accredited laboratory, 6) Sharing of test results, communication and Follow up protocol, and 7) Patient Care Navigation for getting individuals to situated in a medical home in the targeted zip codes.

Colorectal cancer (CRC) is the third most common cancer and the third leading cause of cancer death in both men and women in the United States[4]. Despite a steady decline in overall cancer incidence and mortality rates[5,6], an estimated 141,210 new cases of colorectal cancer and 49,380 deaths from this disease are expected to occur in 2011. Certain cancers in minority groups have failed to decline[4] and relative geographic disparity in certain regions has remained stable[6] .

For 2012, The American Cancer Society's estimates the number of colorectal cancer cases in the United States are for 2012:

- 103,170 new cases of colon cancer
- 40,290 new cases of rectal cancer

The lifetime risk for developing colorectal cancer is about 1 in 20 (5.1%). This risk is slightly higher in men than in women[4].

Disparities in Colorectal Cancer Morbidity and Mortality

Colorectal cancer incidence and mortality show extreme health disparities, with a disproportionate burden occurring in certain minority populations, including African Americans and Alaska Natives.[2,3] The COCAS Project will aim to increase CRC screening at the community level among all individuals in the target zip codes but will particularly focus on African Americans since the greatest disparity in morbidity and mortality are among this population.

Why is screening and early detection important?

Screening for cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to

identify those having unrecognized cancer. Current levels of screening in this country lag behind those of other developed countries. It has been estimated that attainment of goals for population colorectal cancer screening could save 18,800 lives per year.[1] The death rate (the number of deaths per 100,000 people per year) from colorectal cancer has been dropping for more than 20 years. There are a number of likely reasons for this. One is that polyps are being found by screening and removed before they can develop into cancers. Screening also allows more colorectal cancers to be found earlier, when the disease is easier to cure. In addition, treatment for colorectal cancer has improved over the last several years. As a result, there are now more than 1 million survivors of colorectal cancer in the United States.

Despite this, Texas falls in the list of States with the lowest screening rates in the country. According to the Behavioral Risk Factor Surveillance system (BRFSS), only 54.1-59.2% of adults aged 50-75 self-reported being up to date with colorectal cancer screening. http://www.cdc.gov/cancer/colorectal/statistics/screening_rates.htm.[7]

In over two decades of research it has been established that screening rates can be improved through a variety of community based and clinic based techniques.[8] (Pasick, Hiatt, & Paskett, 2004). The most effective interventions have combined multiple strategies to achieve the most optimum outcomes.

The COCAS Project will focus on increasing screening and removing barriers to screening among 50-75 year olds through community level evidence based strategies that are culturally appropriate in high risk zip codes. The project will provide materials for an awareness campaign in targeted zip codes, provide small group education, provide access to screening and lab testing facilities and enlist community health workers as patient navigators to connect all enrolled community members access to primary care, preventive care and a medical home. Assistance with enrollment and the effect of the Affordable Care Act on preventive care will be clarified. Those that need follow up care will be connected to a sliding scale (if needed) County facility through their medical home. All enrollees will be referred to a medical home and will be under the care of a medical provider, if they are not already.

United States Preventive Service Task Force (USPSTF) Assessment

Major organizations such as U.S. Preventive Services Task Force, USPSTF, (a group of experts convened by the U.S. Public Health Service), the American Cancer Society, and professional societies, have developed guidelines for colorectal cancer screening. The USPSTF recommends screening for colorectal cancer (CRC) using fecal occult blood testing, sigmoidoscopy, or colonoscopy, in adults, beginning at age 50 years and continuing until age 75 years and grades these screening strategies as an “A”. The USPSTF concludes that, for fecal occult blood testing, flexible sigmoidoscopy, and colonoscopy to screen for colorectal cancer, there is high certainty that the net benefit is substantial for adults age 50 to 75 years . The test used will be High-Sensitivity Fecal Occult Blood Test (FOBT) or Stool Test; or Fecal Immunochemical Test (FIT) Note: There are two types of FOBT: one uses the chemical guaiac to detect blood. The other—a fecal immunochemical test (FIT) uses antibodies to detect blood in the stool.

The COCAS Project will focus on removing barriers to FOBT testing at the community level by providing ready access to education, screening and testing and in encouraging adherence to screening guidelines. National results showed there was capacity to screen everyone in need of colorectal cancer screening within one year using fecal occult blood tests (FOBTs) followed by colonoscopy for those who tested positive.[1,2] Studies have shown that FOBT, when performed every 1 to 2 years in people ages 50 to 80, can help reduce the number of deaths due to colorectal

cancer by 15 to 33 percent (1-3). CDC conducted the study at the national level and in selected states (Colorado, Georgia, Iowa, Maine, Maryland, Massachusetts, Minnesota, Michigan, New Mexico, New York, North Carolina, South Carolina, Ohio, Texas, and Washington). National results showed that it would take five to 10 years to develop the resources to screen everyone as recommended using only colonoscopy or flexible sigmoidoscopy. However, several states had enough resources to screen with these two tests within three years.[1,2]

Target Zip Codes

To locate high risk areas, age-adjusted purely spatial cluster analysis identified twelve statistically significant clusters of CRC incidence. The primary cluster was located in south central Houston, an area referred to as "Sunnyside," a low-income African American community. Adjusting for area-level poverty made little discernible impact on the spatial distribution of these clusters, suggesting that poverty rate did not explain these findings. A similar analysis of late stage diagnosis identified 157 significant clusters across the study area, with the primary cluster again in the Sunnyside area. Adjusting for poverty eliminated all clusters with the exception of clusters in southeast Houston (Sunnyside) area for late-stage diagnosis, suggesting that areas with elevated late-stage CRC incidence were due to high poverty in these areas, with Sunnyside being an exception since factors in addition to poverty appeared to be contributing to the high rates. Significant spatial clustering of incidence appeared during two time intervals within the 13-year span of data. The earlier time period (1996-2001) shows a more widely dispersed arrangement of clusters in south central, southwest, and northwest Houston, with the primary cluster in the Southeast Houston (Sunnyside) area. The latter time period (2002-2007), however, indicates that clustering shifted toward north central and northeast Houston, with the strongest clustering in the northeast (Trinity/Houston Gardens) area

The COCAS Project will focus on these two areas of the city that were identified as having the most significant clustering of late stage diagnosis. The two areas and the corresponding zip codes are Sunnyside – 77021, 77033, 77045, 77047, 77048, 77051, 77054, 77061, 77087; Trinity-Houston Gardens – 77016, 77026, and 77028.

Goals and Relationship to Regional Goals:

The goals of the project are to increase screening rates in high risk zip codes and encourage adherence to screening guidelines in order to alleviate disparities in CRC outcomes in targeted areas.

Project Goals:

This project meets the following regional goals: Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.

Challenges:

The performing provider anticipates that there will be challenges in buy-in and recruitment from the target population. There are expected to be challenges in enlisting stakeholders and partners to make the COCAS project a success. Resistance and push back in behavior change regarding preventive care is also expected. The project team will prepare to address these challenges and will have strategies in place to conduct both passive and active recruitment into the COCAS project. The recruitment venues will be expanded to be community wide. Screening kits will be provided and access to testing will be facilitated for those enrolled in the COCAS Project.

5 Year Expected Outcome for Providers and Patients:
The performing provider expects that there will be an increase in screening knowledge, awareness and recommended guidelines. An increase in screening is also expected during this time in the target communities. The impact of the Affordable Care Act and its implications on cancer screening will also unfold during this time and changes are expected that will make available widespread screening in the community.

Starting Point/Baseline:
Baseline rates will be established in year 2-3 of the project. All improvements will be measured against the baseline.

Rationale:
People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after the symptoms occur.

Previous research shows that access to screening and removal of barriers to access are the most effective means of improving screening rates. Assuring that there is appropriate followup after screening is critical for the successful implementation of an intervention.[8]

Project Components:
This project does not have specified components. However, the project will address : 1) Awareness campaign utilizing culturally appropriate messages, 2) CRC Education about Screening Guidelines and Recommendations, 3) Access to Community wide Non-invasive FIT testing, 4) Test taking training, 5) Testing by nationally accredited laboratory, 6) Sharing of test results, communication and Follow up protocol, and 7) Patient Care Navigation for getting enrolled individuals to situated in a medical home in the targeted zip codes.

Unique community need identification numbers that project addresses:
- CN.20 Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs
- CN.22 Insufficient access to services that are specifically designed to address racial, ethnic and cultural health care disparities

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
The COCAS Project represents a new initiative because 1) it is a community based population health screening initiative 2) it addresses and aims to alleviate health disparities in CRC morbidity 3) it is targeted to specific geographic areas in the city 4) it aims to use materials and intervention strategies that are culturally appropriate 5) it will be one of the first widespread community screening projects where all aspects of access to screening and removal of barriers is addressed.

Quality improvement procedures will be put in place and lessons learned will be shared. Opportunities to scale up the COCAS project in additional high risk target areas will be examined.

Related Category 3 Outcome Measures:
IT- 12.3 Colorectal Cancer Screening
Improve CRC screening rates utilizing FOBT in targeted areas among individuals enrolled in COCAS
IT- 11.3 Improve utilization rates of clinical preventive services in target population with identified disparities- Improve utilization rates of preventive services (CRC Screening) following established guidelines to reduce disparities.

Reasons /rationale for selecting the outcome measures:

The two outcome measures selected were 1) Improve CRC screening rates at a large scale population level 2) Improve utilization of preventive services according to established guidelines to alleviate health disparities. The COCAS Project will promote FOBT testing at a community level. The national body of experts, USPSTF, has graded CRC Screening utilizing FOBT as "A", the highest rating for an intervention – which indicates that this Taskforce has established FOBT has having a significant net benefit in reducing morbidity and mortality due to CRC. The guidelines suggest that those that have a positive FOBT, will need to get a colonoscopy as a follow-up test to detect polyps or other conditions. Additionally, all those who were screened positive by FOBT have a high likelihood of getting follow-up screening, if needed, within one year since most States have the capacity to complete this.[1,2] Colonoscopy is recommended once every ten years and has some risks associated with it, in addition to being costly. It is not feasible to screen for CRC using colonoscopies at the widespread population level. FOBT is preferable at a widespread community level because of its easy administration, non-invasive nature, low cost and ease of follow-up.

Relationship to Other Projects and Other Performing Providers' Projects: The increase of primary care and specialty care will naturally result in additional ambulatory care encounters for our region patient base. The ambulatory initiatives cover items such as laboratory, PT/OT, social work, etc. and are a necessity of our patients to ensure a comprehensive treatment for access as well as cost avoidance. The Region 3 initiative grid in the addendum reflects all ambulatory operations initiatives.

Plan for Learning Collaborative:
Project results and lessons learned will be disseminated to other members in the regional learning collaborative to share lessons learned and discuss quality improvement strategies. We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:
HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs, 4)Cost Avoidance, 5) Partnership Collaboration, and

6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.

HDHHS gave the Prioritization score a weight of 50% and the Public Health Impact score a weight of 50% to determine the overall project value for the plan. CRC received a composite Prioritization score of 2.29 and a Public Health Impact score of 2.29.

Project Option 2.19 Develop Care Management Function that integrates primary and behavioral health needs of individuals- Integrated Services for the Homeless

Unique Project ID: 0937740-08.2.9 / Pass 2

Performing Provider Name/TPI: Houston Department of Health and Human Services/0937740-08

Project Summary: Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas with a population of 2.1 million in 2010. HDHHS has 1,100 employees and a budget of $100,245,403. HDHHS serves the City of Houston through 44 distinct programs. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring and restaurant inspections; birth and death certificates; leadership in emergencies such as hurricanes; operates a comprehensive regional reference laboratory, provides communicable disease prevention and control services and disease surveillance and a variety of health and human services such as the Women, Infants and Children (WIC) nutrition program, senior nutrition services, family planning, oral health services and immunizations via a network of 4 health centers, 14 WIC sites and the Harris County Area Agency on Aging.

Intervention(s): This new Homeless project will serve 200 individuals who are chronically homeless and offer comprehensive service integration intervention. This project will implement its comprehensive five step intervention for the homeless involving 1) permanent housing supportive model 2) program service linkages 3) physical and behavioral health needs 4) financial support 5) other services.

Need for the Project: There is a great need for an integrated system of care for the homeless. There are at least 2000 chronically homeless individuals in Houston according to the last count performed by the Homeless Coalition. People experiencing chronic homelessness have the following characteristics: 1) typically male (79-86%) and middle age (60% are 35-54), 2) 63% unsheltered, 3) almost 100% with presence of disabilities & frequently multiple disabilities at once and 4) frequently use emergency rooms, hospitals, mental health services, veterans' services, substance abuse detoxification and treatment, and criminal justice resources. (Chronic Homelessness Policy Solutions, Chronic Homelessness Brief March 2010, National Alliance to End Homelessness).

Target Population: The project targets individuals with histories of mental illness, addiction, complicated medical problems and meet HUD's definition of chronic homelessness and frequent users of hospitals and crises response systems.

Category 1 or 2 expected patient benefits: Increase patient/target population utilization rates of each aspect of program (Housing, program services, physical and behavioral needs, financial services and other services) by 2% over baseline in DY4 and by 5% over baseline in DY5.

Category 3 outcomes: IT-9.4 Other Outcome Improvement Target - Reduce non emergent ED usage in program participants by 5% over baseline in DY4 and by 10% in DY 5.

Project Option 2.19.2: (Other) Develop Care Management Function that integrates primary and behavioral health needs of individuals- Integrated Services for the Homeless

Unique Project ID: 0937740-08.2.9 / Pass 2
Performing Provider Name/TPI: City of Houston Department of Health and Human Services/0937740-08

Project Description:

HDHHS proposes a comprehensive project to integrate evidence based and best practice models such as Housing First to reduce chronic homelessness and associated health and other public system costs.

The project will strive to create an integrated system of care that will effectively house and provide supportive services to homeless individuals. Evidence based programs and practices (described in program components below) will be implemented and linked with permanent supportive housing in order to permanently house homeless individuals and subsequently engage them in intensive supportive services. Investments in this model of service will ultimately result in reduced health care and other public system costs to the community and increased housing stability. A collaborative partnership will be developed between the Mental Health Mental Retardation Authority in Houston, the City of Houston Housing & Health Departments, and the Houston and Harris County Housing authorities to develop, fund and implement a demonstration project that provides permanent housing and supports to 200 individuals who are chronically homeless. Housing units will be linked to intensive supportive services that are tailored to individual needs of the participants served by the project.

Need for project

Housing and Urban Development's (HUD) definition of chronic homeless is four or more episodes of homelessness within the past three years or one or more current consecutive years of homelessness. In addition, the individual must have a disabling condition which makes daily activities difficult (e.g. medical, psychological, substance abuse). As reported by the Houston Homeless Coalition, over one in three (34.4%) or 1315 individuals of the 3824 unsheltered homeless people who were counted in the Point in Time (PIT) enumeration conducted in Houston in 2012 met HUD's definition of chronic homeless.

Among those in emergency shelters, transitional housing, or safe haven on the night of the PIT count, one in four (25.7%) or 745 individuals of the 2902 sheltered homeless was classified as a chronically homeless individual. Additional data obtained on those staying in shelters that night show that 12.9% had severe mental illness and 21.4% were chronic substance abusers. The PIT count indicates there at least 2000 homeless individuals in Houston/Harris County who meets HUDs definition of chronic homeless.

Research has shown that many chronically homeless people have disabilities such as serious mental illness, chronic substance use disorders, or chronic medical issues and are homeless repeatedly or for long period of time. People experiencing chronic homelessness have the following characteristics: 1) typically male (79-86%) and middle age (60% are 35-54), 2) 63% unsheltered, 3) almost 100% with presence of disabilities & frequently multiple disabilities at once and 4) frequently use emergency rooms, hospitals, mental health services, veterans' services, substance abuse detoxification and treatment, and criminal justice resources. (Chronic Homelessness Policy Solutions, Chronic Homelessness Brief March 2010, National Alliance to End Homelessness). Early engagement in appropriate services to address the multiple conditions for many of these indigent individuals, as well as their needs for housing and social support,

requires both behavioral health case managers and chronic disease care managers working closely to make service settings accessible and to track progress in this target group.

Some of the models that will be adapted for this demonstration project include the Corporation for Supportive Housing Frequent Users Systems Engagement (FUSE) model, Housing First, SOAR and ACT and Integrated Health Care for this project.

The FUSE process (http://www.csh.org/csh-solutions/community-work/systems-change/fuse/) will be utilized to guide the effort toward system integration. FUSE helps communities break the cycle of incarceration and homelessness among individuals with complex behavioral health challenges. The three components of the FUSE model include 1) data-driven problem solving, 2) policy and systems reform and 3) targeted housing and services. Implementation of the model will result in identification and engagement of frequent users of multiple systems (jails, homeless shelters and crisis health services, tracking and measuring of outcomes/impacts and cost-effectiveness, policy & system reforms through the work of an interagency, multi-sector work group and implementation of a Housing model that will lead to increased housing stability and reduced system costs.

Target Population

The project will target individuals with histories of mental illness, addiction, complicated medical problems and meet HUD's definition of chronic homelessness and are frequent users of hospitals and crises response systems.

This integrated program for the homeless individuals will comprise of 1) housing, 2) program services 3) physical and behavioral medical needs 4) financial support and 5) other needs.

1) Housing

The project will use a permanent supportive housing model using the Housing First approach (http://www.seattle.gov/housing/homeless/HousingFirst.htm)as the primary solution. This intervention moves people off the street or out of temporary shelter into stable, affordable housing and combines housing with supportive treatment services in the areas of mental and physical health, substance abuse, education, and employment. Evaluations of permanent supportive housing have demonstrated significant improvements in housing stability, reduction in days of homelessness, and reductions in the utilization and costs of public services such as emergency shelter, hospital emergency room and inpatient care, sobering centers and jails. The Housing First model has been demonstrated to be effective for people with co-occurring psychiatric and substance use disorders who are homeless. The model provides a stable living environment in which various needed psychiatric services and other medical services can be delivered.

2) Program Services

Linking services with the permanent housing model is essential to achieve housing stability and to realize savings in the public systems of care. Behavioral health services will include Assertive Community Treatment services, crisis intervention and other intensive case management services. ACT is a self-contained program that serves as the fixed point of responsibility for providing treatment, rehabilitation and support services to identified consumers with severe and persistent mental illnesses and substance abuse. Using an integrated services approach, an ACT team merges clinical and rehabilitation staff expertise, e.g., psychiatric, substance abuse, employment, and housing within one mobile service delivery system. ACT team members include psychiatrists, licensed mental health professionals, registered nurses, supported employment specialists and supported housing specialists.

3) Physical and Behavioral Health Needs

Program design is inclusive of service coordination, rehabilitative services, psychiatric services, nursing services, medication management, housing support, substance abuse treatment, and vocational services. The ACT team also works with families to provide education and support. Services are need-based vs. time-limited and provided in the consumer's natural environment (i.e. permanent supported housing) the majority of the time. Services provided by an ACT team are focused on reduction of hospitalization and include outreach, engagement and stabilization. The ACT will be responsible for crisis services, hospital admissions and discharge planning.

Programs of Assertive Community Treatment have been around since the early 1970s. The original model developed by Arnold Marx, M.D., Leonard Stein, M.D., and Mary Ann Test, Ph.D., in Madison, Wisconsin, was intended to demonstrate the effectiveness of providing comprehensive services delivered by a multi-disciplinary team to persons who had not responded to traditional mental health service approaches. Assertive Community Treatment (ACT) teams in Texas represent a system wide replication of the National Alliance for the Mentally Ill endorsed Program for Assertive Community Treatment (PACT) model.

The team will implement the Dartmouth or similar model for providing health care through the use of a multi-disciplinary team approach.

4) Financial Support

SOAR is a federal program that helps states and communities increase access to Social Security disability benefits for people who are homeless or at risk of homelessness and who have mental illnesses or other co-occurring disorders. The initiative does this by creating collaborative partnerships between state and federal agencies that allow case managers and clients to more easily navigate the SSI/SDDI application process. Team members who provide case management and navigation support on the care team will be trained in SOAR to increase the number of successful applications for public benefits. Without the assistance of the SOAR program only 10-15% of homeless populations have their disability applications approved. Overall those using the SOAR process have an overall SSI/SSDI application approval rate of 71%.

5) Other services

Other services that will be provided for participants include meetings with extended family, reinforcement of coping skills, assistance in determining appropriate family and community supports, linkage into appropriate ongoing services and alumni groups facilitated by peer navigators. The project will use Certified Peer Specialists to assist homeless individuals in the recovery process. Peer Specialists are individuals who are in recovery from a mental illness and who use their lived experience to assist other individuals in their own recovery. Peer specialists provide a variety of peer support services. Their primary asset is the ability to share their story and inspire hope for recovery. (Via project specific website called “Hope”).

Additionally, the project will work to capitalize on new opportunities afforded in the Affordable Care ACT to maximize access and use of Medicaid benefits to improve access to primary care.

Goals and Relationship to Regional Goals:

The goal of the project is to offer a community based service where homeless individuals that have multiple physical and behavioral comorbidities can receive housing, medical and behavioral care, services and referrals to address their needs without being utilizing the ER.

This project meets the following regional goals:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.

Challenges:

Some of the challenges anticipated by the program are location of appropriate housing, with either renovation or new construction, access to housing vouchers or other housing funds, attracting qualified providers in adequate numbers, coordinating services across agencies and engaging chronically homeless individuals to participate in the project. These challenges will be met by collaborating with partner agencies, support of local governmental and non-governmental entities and continual quality improvement built into the program. Extensive training and education of the program staff will be implemented to make the program a success. Resistance to buy in from homeless target population will be overcome by using appropriate strategies such as peer trainers and peer support groups.

5 Year Expected Outcome for Provider and Patient:

It is expected that individuals will decrease admissions to inpatient hospitalizations, Individuals will spend majority of their time stably housed, more than half will accrue supportive services cost significantly lower than were accrued prior to program participation, and most will decrease number of days spent in jail. (SAMHSA, National Registry of Evidence Based Programs and Practices)

Starting Point/ Baseline:

Baseline data will be collected during year 2 and 3 of the project

Rationale:

Research has documented cost savings associated with housing and supportive services. These services when coupled not only achieve housing stability but also improve health outcomes and decreases the use of publicly-funded institutions

The Frequent Users of Health Services Initiative was a five-year, $10 million project jointly funded by The California Endowment and the California HealthCare Foundation. The goal of the initiative was to promote the development and implementation of innovative, integrated approaches to addressing the comprehensive health and social service needs of frequent users of emergency departments Researchers found that homeless clients connected to permanent housing had greater reductions in emergency department use and charges compared to those who remained homeless: 34% fewer emergency department visits, 27% fewer inpatient admissions, and 27% fewer inpatient days.

The Chicago Housing for Health Partnership (CHHP) is a “hospital-to-housing” effort that identifies chronically ill homeless individuals at hospitals, moves them to permanent supportive housing, and provides them with intensive case management services so that they can maintain their health and secure long-term housing stability. The Intervention Group participants had high rates of long-term substance abuse (86 percent), mental illness (46 percent), and medical issues such as HIV/AIDS (34 percent), and hypertension (33 percent), as well as a number of other chronic medical illnesses such as diabetes and cancer. The intervention group had a relative reduction of 29% in hospitalizations, 29% in hospital days, and 24% in emergency department visits.

The Denver Housing First Collaborative (DHFC) The DHFC is designed to provide comprehensive housing and supportive services to chronically homeless individuals with

disabilities. The program uses a housing first strategy combined with assertive community treatment (ACT) services, providing integrated health, mental health, substance treatment and support services. A cost-benefit analysis of the program documented an overall reduction in emergency service costs for the sample group. The total emergency related costs for the sample group declined by 72.95 percent, or nearly $600,000 in the 24 months of participation in the DHFC program compared with the 24 months prior to entry in the program. The total emergency cost savings averaged $31,545 per participant. In addition to saving taxpayers money, the local and national evaluations of the DHFC program document overall improvement in the health status and residential stability of program participants. Fifty percent of participants had documented improvements in their health status, 43 percent had improved mental health status, 15 percent had decreased their substance use, and 64 percent had improved their overall quality of life. Furthermore, the overall quality of life for the community improved as the negative impacts of individuals living and sleeping on the streets were reduced.

Project Components:

This project does not have any specified project components. However, the project will achieve its goals by a comprehensive package consisting of the following, depending on the specific needs of the target population:

- Linking Participants with Housing
- Program Services
- Behavioral and Physical Health Needs
- Financial Services
- Other services

Unique community need identification numbers the project addresses:

The Integrated Mental Health with Housing First initiative also addresses the issues addressed in the following community needs assessments:

- CN.6 Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly.[2,3]

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

Although various models exist to meet the needs of an indigent population, this program adopts and adapts critical elements of many of these evidence based programs (described in the narrative) to improve health and social outcomes in the homeless populations enrolled in this program. Additionally, the program is also innovative because it utilizes peer trainers who can provide a unique perspective and help new program enrollees achieve success in program outcomes.

<u>Related Category 3 Outcome Measures:</u>

IT-9.4- Other Outcome Improvement Target

Indigent homeless individuals typically suffer from multiple comorbidities. Along with physical health problems many, if not most also suffer from mental health conditions. These comorbidities and the resulting poor health is compounded by their unstable living conditions. We chose to measure non-emergent inappropriate ED use as our outcome measure. By providing a comprehensive set of services through our program for those enrolled including access to physical (primary care) and behavioral providers and addressing their housing needs, we expect reduced ED use in these individuals.

According to a recent study from 2010, homeless people who seek care in urban EDs come by ambulance, lack medical insurance, and have psychiatric and substance abuse diagnoses

more often than non-homeless people. The high incidence of repeat ED visits and frequent hospital use identifies a pressing need for policy remedies. Compared with others, ED visits by homeless people were four times more likely to occur within three days of a prior ED evaluation, and more than twice as likely to occur within a week of hospitalization. This indicates the need to address the frequent inappropriate ED use by the homeless population at greater numbers than others. http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2848264/

Relationship to Other Projects and Other Performing Providers' Projects: The cohabitation of primary care and behavioral health is an important focus of our region in order to treat the patient base with comprehensive physical and behavioral healthcare issues. There are multiple initiatives in our RHP plan that address this need and all can be found on the Region 3 Initiative Grid in the addendums. The outcome measures focused to screening measures and access of the patient base.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project valuation: HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). Consistent with other participants in the regional partnership, HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category. Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.

HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The Integrated Services for the Homeless Program received a composite Prioritization score of and a Public Health Impact score of 50%.

City of Houston Department of Health and Human Services

Pass 3

2.12.3: Implement/Expand Care Transitions Programs, "Other" project option to reduce the incidence of hospital readmissions within 30 days of discharge of Medicare Fee For Service and Dual Eligible individuals that are hospitalized resulting from the following chronic diseases; Heart Failure (HF), Acute Myocardial Infarct (AMI) Pneumonia (PNE).

Unique Project ID: 0937740-08.2.1

Performing Provider Name/TPI: City of Houston Department of Health and Human Services/0937740-08

Project Summary: Provider: The performing provider, Houston Department of Health and Human Services (HDHHS) is the public health authority for Houston, Texas, the fourth largest city in the U.S., with a population of 2.1 million in 2010. Established in 1840, HDHHS has grown to a department of 1,100 employees. HDHHS provides core public health services to all Houston residents such as air and water quality monitoring; restaurant inspections; lead paint safety; cancer screening and family planning for the uninsured; communicable disease prevention and control; disease surveillance; birth and death certificates; leadership in emergencies such as hurricanes; services to seniors; WIC programs; immunizations; and others. HDHHS operates 11 multi-service centers, 4 health centers, 14 WIC (Women, Infants and Children nutrition program) sites, the Harris County Area Agency on Aging, a comprehensive regional reference laboratory, and 44 health and human service programs. While HDHHS provides services that benefit all Houston residents, the department also takes additional steps to support those most in need, such as low income mothers and children, the elderly, and minority populations.

Intervention(s): This expansion project, modeled after an existing Coleman Transitions Intervention , utilizes case managers, coaches and navigators to improve transitions of patients from the inpatient hospital setting to other care settings, improve quality of care, reduce avoidable readmissions for high risk heart failure beneficiaries and document measurable savings to the Medicare program.

Need for the Project: Many Medicare patients discharged from an inpatient return to the hospital within 30 days. Nearly one in five Medicare patients discharged from a hospital—approximately 2.6 million seniors—is readmitted within 30 days, at a cost of over $26 billion every year. Many of these hospital readmissions are considered to be avoidable and indicators of poor care or missed opportunities to better coordinate care.

Target Population: The primary target population is at risk patients ages 60 years or older. The majority of clients will be Medicaid or Medicare beneficiaries. This project will expand to additional geographic areas beyond the are covered by the current project.

Category 1 or 2 expected patient benefits: [I-11]: Improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transitions policies by 5% over baseline in DY4 and by 10% over baseline in DY5.

Category 3 outcomes1 [IT-3.2] Reduce Congestive Heart Failure 30 day readmission rate by 10% over baseline in DY4 and by 25% over baseline in DY5 among individuals that complete the program.

2.12.3: Implement/Expand Care Transitions Programs, "Other" project option to reduce the incidence of hospital readmissions within 30 days of discharge of Medicare Fee For Service and Dual Eligible individuals that are hospitalized resulting from the chronic disease specifically, Congestive Heart Failure (CHF).

Unique Project ID: 0937740-08.2.10 / Pass 3

Performing Provider: City of Houston Department of Health and Human Services/ 0937740-08

Project Description:

The performing provider, Houston Department of Health and Human Services (HDHHS) proposes to implement a program, modeled after Coleman Transitions Intervention to improve transitions of patients from the inpatient hospital setting to other care settings, to improve quality of care, to reduce avoidable readmissions for high risk heart failure beneficiaries, and to document measurable savings to the Medicare program.

Hospitalizations are costly, accounting for approximately 31 percent of total health care expenditures. Many Medicare patients discharged from an inpatient return to the hospital within 30 days. In Medicare, inpatient care accounts for 37 percent of spending, and readmissions contribute significantly to that cost: Nearly one in five Medicare patients discharged from a hospital—approximately 2.6 million seniors—is readmitted within 30 days, at a cost of over $26 billion every year. Some of these readmissions are planned, and others may be part of the natural course of treatment for specific conditions; but, increasingly, some hospital readmissions are considered to be avoidable and indicators of poor care or missed opportunities to better coordinate care.

Hospital readmissions may be prevented. With nearly one in five Medicare patients returning to the hospital within a month of discharge, the government considers readmissions a prime symptom of an overly expensive and uncoordinated health system. Multiple factors contribute to avoidable hospital readmissions: they may result from poor quality care or from poor transitions between different providers and care settings. Likewise, such readmissions may occur if patients are discharged from hospitals or other health care settings prematurely, are discharged to inappropriate settings, or do not receive adequate information or resources to ensure continued progression. A lack of system factors, such as coordinated care and seamless communication and information exchange between inpatient and community-based providers, may also lead to unplanned readmissions. Hospital readmissions may adversely impact payer and provider costs and patient morale. Repeated hospital admissions may also demoralize patients and leave them feeling lost and confused.

CMS has recognized that it is important for the medical community to work collaboratively with community based organizations and other local service providers to address hospital readmissions. This performing provider will expand upon a partnership with The Methodist Hospital part of the Methodist Hospital System (TMHA) to expand a Community Care Transitions Program (CCTP) using the Coleman Care Transitions evidence based model. The will performing provider conducts an existing CCTP project.

Recruitment strategy and program promotion-All hospital staff will receive oral and written communication through hospital leadership such as the Chief Operating Officer and the Chief Nursing Officer regarding the hospital care transitions program. Physicians, nurses, social workers, and other professionals will be encouraged to flag any patient with CHF so that the Transitions Coach can formally invite them to participate in the program. Physicians and staff nurses will be given direction on how to share the program benefits with patients. Program notification and beneficiary communication materials will be posted and distributed throughout the hospital.

Families of admitted patients will receive information about this program as part of the admission process. Visual displays describing the program will be posted in the inpatient areas and Emergency Room so that patients and/or families are prompted to ask questions. A "Fast-Facts" explaining the program will also be sent to physicians with hospital privileges who admit patients from the community, describing the benefits of the program and encouraging their identification of Medicare patients who may be eligible. This communication method will also be used to update physicians regarding the results of the program. When qualified patients are identified as not enrolling in the program, an analysis will be done to identify methods that may be employed in the future to facilitate enrollment. Additionally, hospital staff will receive reminders about the program at regularly scheduled monthly service line staff meetings.

If a patient who is a Medicare and/or Medicaid beneficiary or an at risk 60 year old or older and is admitted to the hospital with an diagnosis of CHF and it is determined by the hospital that the patient is at high risk for readmission, the patient will be asked if they are interested in participating in the Care Transitions Program (CTP). Participants will be placed in a Tier System based on the level of need and physical impairment. Social Workers/Case Managers will be trained to be Coaches in the Care Transitions Intervention to assist patients. A Social Worker/Case Manager team lead will triage Coaches based on the Tier system. Tier 1 will address the most critical needs. This team will consist of Coaches only. Tier 2 will address intermediate needs. This team will consist of a Coach with assistance from a Navigator. Tier 3 will address minimal needs. If necessary, the Navigator will consult with a Coach. Coaches will work with Navigators when necessary based on the Tier system. Navigators will assist with information, referral and assistance and activities of daily living in the home if needed.

Cost savings to the Health Care system and CMS are projected at $864,000, $1,296,000 and $1,728,000, $2,160,000 for years 1,2,3 and 4 respectively.

It is important to note that this cost savings is only derived based on the anticipated reduction in readmissions, and does not include expected savings from other reductions or changes in patient utilization patterns; the performing provider considers this to be a conservative estimate of the real savings and efficiencies the CCTP program will achieve.

The recruitment strategy is as follows:
The case manager/discharge planner in the hospital will assess whether the CHF patient is a good candidate for the program. If the patient is at risk for readmission, a referral will be sent to the Coach by the case manager/discharge planner. The Coach will ask the patient if they want to participate in the program and explain the four pillars of the Coleman Transitions Intervention . If the patient agrees to participate, consent will be obtained.

The hospital case manager/discharge planner will consult with the Coach 48 hours before discharge to ensure a smooth transition from the hospital to the home setting. The Coach will visit the patient to review the four pillars in more depth, arrange a home visit for 48-72 hours post-discharge and a post-discharge follow up doctor's visit will be set. The Coach and hospital case manager/discharge planner will review the patient's discharge plan to determine if any in-home or ancillary services such as home delivered meals, personal care or Benefits Counseling provided by the Harris County Area Agency on Aging (HCAAA) or other organizations are needed. These items will be noted and discussed with the patient prior to discharge. When the caller returns home, the Coach will contact the patient or family member 48-72 hours after discharge to solidify the time of the home visit. During the initial home visit, the Coach will help the patient complete the PHR. The Medication Discrepancies tool will also be completed.

When it is determined that supportive services such as emergency response, in-home respite, medication management, home delivered meals, personal assistance services, transportation and/or longer term Care Management are needed to facilitate patients' compliance with discharge orders and optimize patient recovery, the services will be coordinated and/or provided by the Harris County Area Agency on Aging and the Care Connection Aging and Disability Center. The Coach will make two follow up phone calls on days seven and 14 to reinforce the four pillars of the CTI. On Day 30, the Transitions Coach will administer the Care Transitions and Patient Activation Measures. Follow up will be conducted Days 60, 90 and 180 to ensure ongoing adherence to the four pillars, discharge plan, ensure that the patient has secured a medical home and to determine if the patient has been readmitted to the hospital within the 180 day period after discharge.

Patients with congestive heart failure and with the strongest positive association with readmission were discharged against medical advice and covered by Medicaid had more severe loss of function and certain comorbidities such as drug abuse, renal failure, or psychoses.[1] Additionally, nearly one in five Medicare patients discharged from a hospital—approximately 2.6 million seniors—is readmitted within 30 days, at a cost of over $26 billion every year. CMS sites $9600 as average cost of hospital admission and readmission.

- The performing provider in partnership with TMHS-TMC will enroll 75 patients per month in DY3 with a projected completion rate of 45 per month and a 25% reduction in readmission;
- 100 patients per month will be enrolled in DY4 with a projected completion rate of 60 per month and a 25% reduction in readmission;
- 125 patients per month will be enrolled in DY5 with a projected completion rate of 75 per month and a 25% reduction in readmission;

Goals and Relationship to Regional Goals:

The goals of the project are to expand existing Community Care Transitions project/strategies through partnership with Methodist Hospital and

- reduce 30 day readmissions rates of Medicare FFS and Dual Eligible CHF patients
- maintain or improve quality of care
- document measureable savings to the Medicare program

The CCTP project meets the following regional goal by reducing readmissions: Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system,

Project Goals:

The goals of the CCTP are to improve transitions of beneficiaries from the inpatient hospital setting to other care settings, to improve quality of care, to reduce readmissions for high risk beneficiaries, and to document measurable savings to the Medicare program

Expected Outcomes:

Implement CCTP strategies to address factors that contribute to avoidable hospital readmissions and will reduce incidence of hospital readmissions of patients with diagnosis of PNE, HF or AMI.

Baseline Data:

Baseline data will be collected from CMS *Hospital Compare* readmission rates. Program baseline will be established in DY 3.

Community Needs Assessment

This project meets the following community needs assessments.

CN.9: High rates of preventable hospital readmissions

CN.7: Insufficient access to care coordination practice management and integrated care treatment programs.

Challenges:

The performing provider anticipates that there will be challenges in buy-in and recruitment from the target population. Other anticipated challenges are patient education for minimally educated and linguistically isolated patients, incentivizing patients to commit to the program in total (as some patients will agree to participate while hospitalized, but due to day to day stressors of this population will not follow through with program post discharge), home based care for patients with limited family support.

By leveraging the performing provider's experience and established networks in serving low income population, this program will benefit from these experiences. Program processes will be refined and improved through a Plan-Do-Check-Act process. The goal of continuous quality improvement is to establish a cyclical, continuous process of planning, assessing, monitoring, analyzing, measuring and evaluating performance to improve desired outcomes. It is expected that revisions to the protocol, training requirements, partnership processes and expectations will need to be clarified on a regular basis. These will be improved through the PDSA process. Initial program enrollment of a small number of target population will help iron out the program weaknesses and allow for a continuous improvement process.

Related Category 3 Outcome Measures:

IT-3.2 Congestive Heart Failure 30 day readmission rate

Reasons/rationale for selecting the outcome measures:

Heart failure is associated with high rehospitalization rates, often due to preventable complications resulting from patients' inability to adequately self-manage the condition and poorly implemented transitions to the next care setting. Programs that provide adequate guidance at discharge, appropriate medication management, and appropriate follow-up with patients during times of transition can reduce readmission rates and improve quality of care. Therefore reduced rehospitalization was chosen as the outcome measure.

(http://www.innovations.ahrq.gov/content.aspx?id=2206).

Relationship to Other Performing Providers' Projects and Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Healthcare costs are significantly increased within a patient base with such aggressive chronic conditions that have gone untreated. The initiatives focused to chronic disease management focus to conditions such as asthma, hypertension, and diabetes and are similar in the approach of managing & proactively treating chronic conditions in order to reduce 30-day readmission rates, inappropriate emergency department utilization, and healthcare costs. The Region 3 Initiative grid allows a cross reference of initiatives associated with chronic disease management. (addendum)

Project valuation:

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). Consistent with other participants in the regional partnership, HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added

to get a composite score for the Public Health Impact category. HDHHS gave the Prioritization score a weight of 50% and the Public Health Impact score a weight of 50% to determine the overall project value for the plan. The Integrated Services for the Homeless Program received a composite Prioritization score of and a Public Health Impact score of 50%.

El Campo Memorial Hospital

Pass 1

Project Option 2.4.1 – Develop and implement a structured patient experience training program: Improving the Patient Experience – The AIDET Project.

Unique RHP Project ID: 131045004.2.1.
Performing Provider Name/TPI: El Campo Memorial Hospital / 131045004

Project Summary:

Provider:
El Campo Memorial Hospital is a 30-bed rural hospital located in Wharton County. It is comprised of a rural health clinic and a home health agency. El Campo Memorial Hospital provided approximately $2 million in charity care revenue in FY 2012.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 533 Swingbed days- 706 Emergency visits- 5,626 Outpatient visits- 11,568 Rural health clinic visits- 35,124 Home health visits- 1,604	Self-Pay- 15% Medicaid and CHIP- 7% Medicare- 46% Other Funding- 4% Commercial Insurance- 28%	Hispanic- 37% African American- 10% Caucasian- 31% Asian- 0.08% Other- 21.92%

Intervention(s):
The AIDET Project is a patient experience training program which was developed by the Studer Group. It is a powerful communication tool.

Need for the project:
The purpose of the project is to improve communication between patients and healthcare providers by enabling our employees with formal training of how to interact with patients to gain their trust which is essential for obtaining patient compliance and improving clinical outcomes.

Target Population:
All patients within the system with may benefit from this project (Medicaid and CHIP-7% / Self-Pay- 15%).

Category 1 or 2 expected patient benefits:
By the end of DY3, our goal is for 90% of employees to have participated in the patient experience training. Our DY4 goal is to develop a display of patient experience data to share internally with employees the efforts we have undertaken to improve the experience of our patients and their families. Our DY5 goal is to share this patient experience data externally to our community.

Category 3 outcomes:
OD-6: Our goal is to increase patient satisfaction scores "To Be Determined" in DY4 and in DY5.

Project Option 2.4.1 – Develop and implement a structured patient experience training program: Improving the Patient Experience – The AIDET Project.

Unique RHP Project Identification Number: 131045004.2.1.
Performing Provider Name/TPI: El Campo Memorial Hospital / 131045004

Project Description:
El Campo Memorial Hospital will develop and implement a structured patient experience training program: Improving the Patient Experience – The AIDET Project.

El Campo Memorial Hospital is a 30-bed rural hospital located in Wharton County. The population of Wharton County is 41,280 per the 2010 Census. The community of El Campo has a population of 11,602 per the 2010 Census. El Campo Memorial Hospital is one of three top employers in El Campo who provide 200 jobs or more. El Campo Memorial Hospital is an acute hospital. We provide basic services including Emergency Room, Radiology, Laboratory, Rehabilitation, Swing Bed, Home Health and Hospice services. We also operate a hospital-based rural health clinic.

El Campo Memorial Hospital plans to roll out The AIDET Project to all new and existing full-time and part-time employees. The AIDET program was developed by the Studer Group. It is a powerful communication tool. AIDET is an acronym for Acknowledge, Introduce, Duration, Explanation and Thank You. When interacting with patients, gaining trust is essential for obtaining patient compliance and improving clinical outcomes. The project goal is to reduce patient anxiety and increase patient satisfaction which will result in positive outcomes for the patient.

We expect to incur scheduling difficulties amongst the targeted population; however, in addition to the live training program that will be conducted, we will also implement a self-study web-based program, so we can accommodate various schedules. By the end of the waiver, our expected outcome is to have 100% of our full-time and part-time employees trained on the patient experience training program, and for the employees and public to be educated on our efforts of improving patient satisfaction for our patients and their families. This project helps achieve the overall goals of the region by promoting positive healthcare experiences throughout the region which will ultimately improve the health of patients and decrease healthcare costs.

Starting Point/Baseline:
The starting point/baseline for this project will be the number of new full-time and part-time employees and the number of existing full-time and part-time employees. As of October 1, 2012, we are expecting to train 134 full-time employees and 4 part-time employees. The number of new full-time and part-time employees is unknown at this time. The time period for this baseline is one year from October 1, 2012 – September 30, 2013; however, we will continue to provide patient experience training even after this date in order to continue our quality improvement process.

Rationale:
Our rationale for selecting project option 2.4.1 Implement processes to measure and improve patient experience was a result of the need for improved communication between patients and healthcare providers. We believe if we can increase patient satisfaction, it has the

potential to increase the level of care integration and coordination of the patient/doctor relationship and lead to better health and better patient experience of care.

Project Components:
All core components will be addressed in this project:

a) Organizational integration and prioritization of patient experience;
b) Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience;
c) Implementing processes to improve patient's experience in getting through to the clinical practice; and
d) Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures,

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
We believe the need for this project could fall under several of the needs reported in the RHP #3 Community Needs Assessment list, but it best is categorized under CN.23 Lack of patient navigation, patient and family education and information programs. If a patient has a good experience, we believe they will continue to actively engage themselves in their future health related care which will ultimately lead to positive outcomes and lower overall healthcare costs. We are not aware of any related activities to this project that are funded by the US. Department of Health and Human Services currently ongoing or coming up in the future.

Related Category 3 Outcome Measure(s):
OD-6 Percent improvement over baseline of patient satisfaction scores.

- IT-6.1 Percent Improvement Over Baseline Of Patient Satisfaction Scores

Reasons/rationale for selecting the outcome measures:

We believe if we can decrease patient anxiety and improve patient satisfaction in the rural setting when the patient is referred to the urban setting for extended/expanded healthcare that they will be more receptive and compliant to their healthcare needs which will ultimately lead to positive outcomes, improved patient satisfaction and ultimately lower healthcare costs. When patients perceive healthcare as a positive process, they will practice healthy lifestyles which results in lower healthcare costs.

We will focus on the stand-alone measure that will monitor an increase in patient satisfaction scores for the measure - patient is getting timely care, appointments, and information. We believe this measure is very important to the overall patient experience. These outcomes are important to our hospital because we believe if patients felt comfortable with the timeliness of their care, they would be less anxious about healthcare processes and more open to working with the healthcare providers. We believe by improving the patient experience through our Category 2 project – developing and implementing a structured patient experience training program, the patient will feel optimistic about their healthcare experience and take care of themselves. Again, we believe by focusing on patient satisfaction for every patient, it will improve the health of low-income population as well as the total population.

Relationship to other Projects: N/A

Relationship to Other Performing Providers' Projects in the RHP:
Healthcare treatment cannot focus to only the acute or chronic encounter and properly treat the patient. It is critical that our region focuses to patient education and community education to ensure a proactive and responsive approach to healthcare needs. The education models represented in the Region 3 RHP plan can be identified in the Initiative Grid (addendum) and all focus to outcome measures such as appropriate utilization, patient satisfaction scores, and standalone chronic condition scores such as diabetes and asthma.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's healthcare system.

Project Valuation: We valued the project based on cost and benefits to our organization. We believe if we can reduce patient anxiety through education, the patient will have positive experiences and positive outcomes which will make them to want to take care of themselves by leading healthier lives, obtaining preventative healthcare and seeking medical help at appropriate times.

Fort Bend County Clinical Health Services

Pass 1

Project Summary - Fort Bend County 2967606-01 2.1
Establish/Expand and Patient Care Navigation Program – Care Coordination Program
Provider: Fort Bend County Clinical Health Services is a division of the Fort Bend County Health & Human Services Department (FBCHHS), the local health department for the County. Fort Bend County is located in the Houston metropolitan area of southeast Texas. It encompasses a total of 875.0 square miles (562,560 acres). The current population is estimated at almost 607,000. FBCHHS services include: Animal Services, Clinical Health Services, EMS, Environmental Health, Social Services, Veterans Services and Public Health Preparedness. Fort Bend County also has a Behavioral Health Services Program.
Intervention: This project will expand patient navigation services to a subset of the uninsured and underinsured population in the county which uses EMS and ED services inappropriately for non-emergent conditions and has no means to pay for the services. Identified patients will be referred into the navigation system to promote a medical home and provide primary care, prevention services and chronic condition management. In addition, linkages to social service agencies to resolve other issues will be provided. Navigation will include follow up for appointment and medication compliance.
Need for the project: While the county population as a whole is wealthy, 8% of the population (48,560) live below the federal poverty level and 19% of the population has no health insurance coverage (>115,000). In one of the county census divisions, more than 17% of the population lives below the federal poverty level. The county has no hospital district and the only health care payment available to the population that does not qualify for Medicaid/Medicare is the Indigent Health Care program which covers only those with an existing medical condition who have an income of less than 21% of the federal poverty level. The program covers up to $30,000 of eligible medical care per year for individuals who qualify for the program, approximately 1,000 per year. In some areas and some populations in the county, when no primary care is available or affordable, the EMS and ED are by default the primary care providers.
Target Population: Uninsured, underinsured and Medicaid covered individuals who do not access primary care and use emergency services in lieu of a medical home. Patients will receive the benefit of ongoing assistance with medical care for primary care, prevention and chronic conditions as well as being linked to needed social services and transportation. Overall health will improve as well as some of the conditions leading to less than optimum health.
Category 2 patient benefit milestones: The program targets a minimum of 95 individuals diverted from high cost EMS transportation and ED visits to the patient navigation system in the FQHC medical home.
Category 3 outcome measures: IT 1.10 – 10% (DY4) and 20% (DY5) reduction in HbA1c poor control (>9%) in the target population. IT 9.2 - 25% (DY4) and 30% (DY5) reduction in ED use in the target population. IT 9.4 - 15% (DY4) and 20% (DY5) reduction in EMS transport use in the target population.

Project Option 2.9.1 - Establish/expand a Patient Care Navigation Program: Care Coordination Program
Unique RHP Project Identification Number: 2967606-01 2.1
Performing Provider Name /TPI: Fort Bend County Clinical Health Services / 2967606-01

Project Description:

Fort Bend County proposes a project where Indigent Health Care, Medicaid and uninsured patients who are frequent or inappropriate users of the County Emergency Medical Service (EMS) and hospital Emergency Departments (EDs) or who have repeat admissions to the hospital would be referred into a care management system based in the local Federally Qualified Health Center.

Care management would include:

- Assistance with making and keeping outpatient appointments
- Assistance with medication needs and medication compliance
- Appropriate case management of chronic conditions
- Dietary and exercise education
- Transportation if needed
- Connection to Social Service agencies for other needs
- A call line to assist clients with determining whether they need EMS, ED or an appointment scheduled at the clinic.

The Care Management Program would be housed within the local Federally Qualified Health Center (FQHC), Fort Bend Family Health Center. This FQHC has in place the protocol to manage patients at the level of preventive care, for management of chronic conditions and outpatient acute illnesses. This project would enhance the capacity, the partnerships and the community connection to the protocol that has been developed. The FQHC would become the medical home for patients referred to and cared for at the facility.

A partnership of the local de facto indigent care hospital, the Federally Qualified Health Center, the Health Department, Emergency Medical Service, and additional community partners would collaborate on a systematic method of identifying frequent users of the high end medical resources who are covered by Medicaid, Medicare, or the County Indigent Health Care program or who are self-pay.

The identified clients would be referred into a care management program at the FQHC led by Community Health Workers. Fort Bend County Health & Human Services will subcontract with the FQHC to provide payment for clients referred by the program whose care is not covered by an insurance program and who cannot afford care. Community Health Workers will assume responsibility for contacting the referred individuals to establish a relationship, set appointments, and assist with medication compliance and encouragement for follow up visits to establish the FQHC as the medical home.

In addition to the Care Management program at the FQHC, Fort Bend County proposes to establish within the EMS department, an Advanced Practice Paramedic (APP) program that will allow for treatment at the home or scene of patients who are calling the 9-1-1 response service for non-emergent health needs. This program will be modeled after successful community primary care APP programs in the United Kingdom, Australia, Wake County, North Carolina and Tarrant County, Texas.

The aim is to provide necessary primary care on scene, avoid an expensive EMS transport and ED visit and also be the link in to the Care Management system at the Federally Qualified Health Center.

Target Zip codes for the program are:

77053	77406	77407	77417	77441	77444
77451	77459	77461	77464	77469	77471
77476	77477	77478	77479	77481	77487
77489	77494	77496	77497	77498	77545

Goals and Relationship to Regional Goals:

The goal of this project is to provide a coordinated program of referrals, care management, patient centered needs resolution, community to medical home connection, and evaluation of program success in a rapid cycle improvement method. The proposed project will add community health worker capacity to the local FQHC and provide payment for services provided to those without means or coverage to pay. The goals include:

- Reduction in use of high end medical resources such as EMS and EDs
- Increase in the number of medically indigent, uninsured, and Medicaid eligible clients who have a medical home, prevention services and chronic disease management
- Improve clinical markers in the individuals served by the project.

The project meets the following regional goals:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system.

Challenges:

The populations that this project seeks to serve have established patterns of behavior that are not conducive to improved health or to cost effective use of existing medical resources. As with any intervention that seeks to change current behavior, the project will need to be patient centered and be flexible to encourage the change in behavior that is desired. Data collection for baseline and rapid cycle evaluation will need to come from a variety of providers and agencies and will need a systematic collection methodology.

5-year Expected Outcome for Provider and Patients:

Fort Bend County expects to see decreases in use of the ED and EMS for non-urgent conditions, to see improvements in health status of the targeted population in terms of clinical markers, follow up with appointments and medications or other interventions and an improvement in recognition of available community resources and the concept of a medical home for all.

Starting Point/Baseline:

Baseline data is not established, although each individual system has some data points as background rationale for the project. Data will be gathered on past and current users of the EMS system, hospital EDs and the Fort Bend County Indigent Care program for non-emergent and for frequent users of the high-end resources to establish the starting point for the proposed program.

In the first six months of the program, data gathering systems will be put in place to monitor the successful referral, engagement and outcomes for the patients who are referred in, using a rapid cycle improvement method.

Rationale:

Fort Bend County does not have a hospital district structure for indigent healthcare or for the uninsured and underinsured population of the County. The County participates in the state mandated Indigent Health Care Program which provides care for qualifying individuals whose income is below 22% of the Federal Poverty Level. With a population estimate of 606,000, there are more than 48,500 (8%) individuals living below the Federal Poverty Level and up to 145,000 uninsured at this time in the County[1]. For these individuals, medical care is often beyond their economic reach. Cash payment options and even sliding scale fees take lower priority than housing payments and food. One of the ways that the indigent population of the County avoids payment up front is to utilize the EMS 9-1-1 response system to obtain a "free" ride to the hospital, to receive priority care in the Emergency Department because of EMS transport and to not have a co-pay on site at the hospital.

Data from the local hospital handling the majority of indigent or uninsured/ underinsured clients in the county, shows that more than two thirds of the ED visits in 2011 were not of an emergent nature. In addition, of the approximately 10,000 patients seen in the first half of this year, 20% were Medicare enrollees, 37% Medicare and Medicaid managed care, and 1% county indigent health care. The remaining 42% are self-pay of which the majority have no means to pay for their health care.

Along with the use of expensive EMS and ED services for non-emergent illnesses, is the use of these same resources for chronic conditions which could better be managed and controlled in an outpatient setting using a medical home approach. Barriers to patients voluntarily seeking this option include lack of knowledge and understanding of their own medical conditions and of the resources available, lack of transportation, inability to pay fees and available hours for care.

The County Indigent Health Care program currently focuses on the need for care once an illness has developed and does not include a preventive or chronic care model.

When a patient is provided stabilization care by the County EMS department and then refuses transportation to the hospital, valuable continuing care coordination and follow-up is lost. A study of frequent users of the County EMS service showed 15,000 patients with more than three uses of the EMS service in a span of 18 months. The highest number was 20 calls in 18 months. The highest number of calls for one individual in the calendar year 2011 was 16 calls, but one individual has already reached 18 calls in the first 8 months of 2012.

Project Components:

Required core project components: 2.9.1

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.

b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.

c) Connect patients to primary and preventive care.

d) Increase access to care management and/or chronic care management, including education in chronic disease self-management.

e) Conduct quality improvement for project using methods such as rapid cycle improvement.

Other project components: 2.9.2
a) Development of an Advanced Practice Paramedic program to provide primary care in the community when individuals are attempting to use EMS and ED resources for non-emergent conditions and chronic condition stabilization.
b) Expand the available call line to allow all identified target population patients to access a community health worker and/or medical professional to assist with determining the level of care needed for a particular complaint – for example EMS and ED vs appointment at the medical home.

Milestones and Metrics:
Process Milestones and Metrics
P-1. Milestone: Conduct a needs assessment to identify the patient population(s) to be targeted with the Patient Navigator program. (Metric P-1.1)
P-3. Milestone: Provide care management/navigation services to targeted patients. (Metric P-3.1)
P-5. Milestone: Provide reports on the types of navigation services provided to patients using the ED as high users or for episodic care. (Metric P-5.1)
P-8. Milestone: Participate in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. (Metric P-8.1)
P-X. Provide primary care to individuals with non emergent needs who call the 9-1-1 EMS for non-emergent conditions or chronic condition stabilization. (Metric P-X.1. Number served, P-X.2. Number referred to the Care Coordination Program)

Improvement Milestones and Metrics
I-7. Milestone: Reduce number of ED visits and/or avoidable hospitalizations for patients enrolled in the navigator program (Metric I-7.1)
I-8. Milestone: Reduction in ED use by identified ED frequent users receiving navigation services. (Metric I-8.1)
I-9. Additional outcome metrics (Metric I-9.1, I-9.2)
I-X. Milestone: Reduce number of EMS transports for patients enrolled in the patient navigator program (Metric I-X.1)
Unique community need identification number the project addresses:
CN.7 Insufficient access to care coordination practice management and integrated care treatment programs.
CN.8 High rates of inappropriate emergency department utilization
CN.9 High rates of preventable hospital admissions
CN.11 High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative.
This project uses the care coordination protocol already in existence within the local FQHC and expands the scope of the protocol to include identified frequent or inappropriate users of the high cost resources of EMS transport services and ED visits. It additionally provides access to the care coordination protocol for those traditionally not involved in coordinated care systems which

can lead to improved health outcomes and reduction in disease driven encounters with EMS and the ED.

Related Category 3 Outcome Measures:

OD-1 Primary and Chronic Disease Management (IT 1.10 – Diabetes Care)
OD-9 Right Care, Right Setting (IT 9.2 – ED Appropriate Utilization / Reduce ED use in target population referred to Care Coordination Program)
OD-9 Right Care, Right Setting (IT 9.4 – Other Outcome Improvement Target / Reduce EMS transport use in target population referred to Care Coordination Program)

Reasons/Rationale for selecting the outcome measures:

One population that could benefit from the proposed care coordination project is the indigent or uninsured population with a chronic health condition. This subset of the target population can indicate whether the chronic health condition is improved by coordination of care, management of medications, education, and having other needs met. For a chronic condition such as diabetes, the chosen improvement target is an easily recorded measure of the effectiveness of the program.

A determined need is to reduce the use of high cost medical resources such as ED and EMS for non-urgent and chronic conditions. The two additional outcome measures seek to determine whether the project is reaching this goal in the targeted population.

Relationship to other Projects: This project supports the Chronic Disease registry and interventions project proposed by our partners, the local hospital authority, and the FQHC. The intention of both projects is to decrease the burden of care on the EMS and emergency departments as well as to establish an improved coordination of care model for chronic and non-emergent conditions that will improve the health of the individuals involved, resulting in improved clinical outcomes and reduce the cost of care.

Relationship to Other Performing Providers' Projects in the RHP:

The ability to properly identify and monitor specific patients with chronic conditions or frequent emergency department utilization trends will allow the region to accurately mange the very large patient base. Patient navigation includes a comprehensive list of tasks as well as unique provider types based on the focus of the initiative and will help the focus of cost containment, emergency department utilization, and chronic disease management. The Region 3 Initiative Grid in the addendum allows for a cross reference of all initiatives proposed within this concept.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

This project addresses the top priority identified by the FBC 1115 Access to Care planning group – a system of Care Coordination for community residents who are medically indigent, uninsured or underinsured. The project aims to reduce EMS and ED use in this population, thereby improving the health of the targeted population by access to ongoing preventive and chronic disease care in a patient centered program as opposed to episodic disease care in high cost resource settings.

Valuation is based on cost avoidance, projecting savings associated with reducing unnecessary EMS and ED use by patients in the target population. Fort Bend County has analyzed cost data

for patients in its indigent health care program. For this population, the cost of ED treatment averaged $3,000 for each of the 129 patients in one year. With a projected 25% reduction in ED visits the anticipated cost savings in one year is $96,750. Using the data for inpatient stays reduced by the project, the cost savings of 25% of the historic 295 inpatient hospital days ($1,400 per day) is $103,250. Adding to this is an anticipated 16.5% avoidance of EMS transports of the 4,161 medically unnecessary responses per year. At $800 cost per call, the yield is an anticipated $549,320 in savings. The total savings anticipated is $749,320 per year of the project.

Fort Bend County Clinical Health Services

Pass 2

Project Option: 2.13.1 – Design, implement and evaluate research supported and evidence based interventions tailored towards individuals in the target population- Fort Bend County Behavioral Health Juvenile Diversion Project

RHP Project Identification Number: 2967606-01 2.2 / Pass 2
Performing Provider: Fort Bend County / 296706-01

Project Summary:
Provider: Fort Bend County (FBC) Clinical Health Services is a division of the Fort Bend County Health & Human Services Department (FBCHHS), the local health department for the County. Fort Bend County is located in the Houston metropolitan area of southeast Texas. It encompasses a total of 875.0 square miles (562,560 acres). The current population is estimated at almost 607,000. FBCHHS services include: Animal Services, Clinical Health Services, EMS, Environmental Health, Social Services, Veterans Services and Public Health Preparedness. Fort Bend County also has a Behavioral Health Services program.

Intervention: FBC will design, implement and evaluate a program that diverts youth with complex behavioral health needs such as serious mental illness or a combination of mental illness and intellectual developmental disabilities, substance abuse and physical health issues from initial or further involvement with juvenile. Services are individualized and community based and include assessment, multi-disciplinary treatment planning, crisis stabilization services, family supports, respite, specialized therapies (trauma focused interventions, cognitive behavioral interventions), medication management, case management and wraparound supports.

Need for the project: In the juvenile justice system the number of youth diagnosed with mental illness is significantly greater than that in the general population. Over the past decade, FBC Juvenile Probation Department has experienced a significant increase in the number of youth with mental health issues. The most recent data indicated that 40% to 45% of the youth in detention are on psychotropic medications. In 2011, FBJPD completed 543 intakes/bookings on youth. It is estimated that approximately 40% of these youth had a mental illness.

Target population: The target population is youth with complex behavioral health needs such as serious mental illness or a combination of mental illness and intellectual developmental disabilities, substance abuse and physical health issues that are at risk of incarceration. The priority population will be the uninsured and Medicaid population.

Category 2 expected patient benefits: FBC expects to reduce the percentage of youth with complex behavioral health needs that are incarcerated. The FBC project also expects improve the functioning of youth served by the FBC BHJD program. The FBC project will serve 10 youth in DY3, 20 in DY4 and 25 in DY5. It is expected that at least 25% of individuals receiving specialized interventions will demonstrate improved functional status on standardized instruments in DY4 and DY5.

Category 3 outcomes: IT 9.1 Reduce % (TBD) of admissions to juvenile detention for youth with complex behavioral health needs.

Project Title: **Fort Bend County Behavioral Health Juvenile Diversion Project**

RHP Project Identification Number: 2967606-01 2.2
Performing Provider Center: Fort Bend County / 296706-01
Project area: 2.13 - Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting: juvenile justice system

Project Option: 2.13.1 – Design, implement and evaluate research supported and evidence based interventions tailored towards individuals in the target population: youth with complex behavioral health needs involved or at risk of involvement in the juvenile justice system.

Project Description: 2.13.1
Fort Bend County (FBC) proposes to develop a program that diverts youth with complex behavioral health needs such as serious mental illness or a combination of mental illness and intellectual developmental disabilities, substance abuse and physical health issues from initial or further involvement with juvenile and to support them in their communities. Services are individualized and community based and include assessment, multi disciplinary treatment planning, crisis stabilization services, family supports, respite, specialized therapies (trauma focused interventions, cognitive behavioral interventions), medication management, case management and wraparound supports.

In the juvenile justice system the number of youth diagnosed with mental illness is significantly greater than that in the general population. It is estimated that up to 70% of the youth in the juvenile justice system have at least one mental health disorder and approximately 20% have a serious mental illness[219]. There is agreement among both mental health and correction systems that many of these youth would be better served in community based programs with clinically appropriate interventions and supports.[220] Youth with mental illness end up on the doorstep of juvenile justice system through a variety of different paths and the juvenile justice system, much like the criminal justice system, has become the default mental health treatment for youth.

In Fort Bend County, the lack of comprehensive and coordinated services for youth with serious mental illness has resulted in the juvenile probation department (including the detention facility) becoming the assessment, stabilization and even treatment center for many of these youth. The most recent Needs Assessment of FBC conducted by the Lyndon Baines Johnson School of Public Affairs in the summer of 2011 states that the lack of services for the mentally ill has resulted in "mental health becoming a law enforcement issue."[221] The same study also indicated the scarcity of mental health services especially for the poor as a priority need for the county. Approximately, 9,000 persons are eligible for CHIP or Medicaid but not enrolled. Mental health services for youth, especially those with no insurance or on Medicaid, and with complex behavioral health needs is a significant need in Fort Bend County.

---

[221] http://www.rgkcenter.org/sites/default/files/file/research/FB%20Report_for_posting.pdf

Over the past decade, Fort Bend County Probation Department has experienced a significant increase in the number of youth with mental health issues. Although the total number of juvenile cases has slightly decreased over the last several years, it is estimated that the number of cases involving mental health disorders, has nearly doubled. A study completed by the Fort Bend Juvenile Probation Department (FBJPD) found that 18% to 20% of the youth in juvenile detention (between 2005 and 2009) were on psychotropic medication. The most recent data obtained from FBJPD indicated that 40% to 45% of the youth in detention are on psychotropic medications. This increase is a direct result of a decrease in treatment services for youth at the community level, a decrease in inpatient treatment services, and the closing of several residential treatment centers in the Houston Metropolitan Area. Consequently, the juvenile justice system has become the default system for providing mental health services to youth. Unfortunately, this is often the start of a cycle with the criminal justice system leading into adulthood.

In 2011, Fort Bend Juvenile Probation Department completed 543 intakes/bookings on youth. It is estimated that approximately 40% of these youth have a mental illness. Many have co-occurring disorders of substance abuse. Furthermore, many struggle with learning disabilities, developmental disabilities, abuse and neglect, and poverty. These vulnerabilities coupled with family problems and legal involvement increase the odds for negative health outcomes.

The Fort Bend County (FBC) Behavioral Health Juvenile Diversion (BHJD) program will focus on the development of specialized interventions and a service delivery system to better identify youth with mental illness and divert them to the appropriate services. This project will interface other FBC proposed DSRIP projects including the Behavioral Health Crisis and Response system. The FBC BHJD program will enhance the safety net, provide necessary interventions, increase the array of services including diversion services, and as a result reduce incarceration of youth with serious mental illness and other complex behavioral health needs as well as improve the functional outcomes for these youth (as measured by the Child and Adolescents Needs and Strengths). The FBC BHJD will include cross systems training and development of data tracking systems to ensure the appropriate response to mental health needs of youth and to monitor outcomes.

The FBC BHJD program will provide intensive care coordination and assessment services at the first point of contact with law enforcement or other intercept point (e.g., schools, hospitals) to identify, triage, and divert youth to appropriate clinical services. The FB BHJD program will also provide intensive care coordination to ensure that youth and their families are connected with the most appropriate level of clinical services in a timely manner. The FB BHJD will work collaboratively with treatment providers to develop individualized treatment plans that address the complex behavioral health needs of the youth and monitor treatment progress. Interventions such as Functional Family Therapy (FFT), Aggressive Replacement Training, Cognitive behavioral Therapy (CBT), respite, crisis stabilization services, and mentoring, wraparound supports may be part of the individualized treatment plans. Follow-up and aftercare services will be essential. As a result, the FBC BHJD program will work collaboratively with public and private behavioral health providers, FBC’s Health and Human Services, physical health providers, Mental Health America (MHA), National Alliance on Mental Illness (NAMI), and behavioral health providers and organizations in the community to provide the necessary array of

services to divert youth from the incarceration and provide the necessary array of services to improve functional outcomes.

The unique community need this project addresses is CN.2 – Insufficient access to behavioral healthcare services, resulting in lack of care or delay of care, delivery of inappropriate and insufficient care, unnecessary and preventable complications, and increased demand on the criminal justice system.

Goals and Relationship to Regional Goals:

Project Goals

FBC expects to see a reduction in the percentage of youth with complex behavioral health needs that are incarcerated. The FBC project also expects to see an improvement in functioning of youth served by the FBC BHJD program.

The FBC BHJD project presents a major opportunity to enhance the service delivery system for a complex behavioral health population (youth with serious mental illness at risk of involvement or further involvement with the legal system). The project also presents the opportunity for development of necessary infrastructure to facilitate communication, access, coordination, evaluation of services and systems transformation. The FBC project is the result of collaboration and commitment among county officials, law enforcement, health and human services, behavioral health (including the Mental Health Authority of Fort Bend County), courts, and community organizations to redesign current county operations to effectively respond to the behavioral health needs in the community.

This project meets the following Region 3 goals:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure that is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction;
- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay; and,
- Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes.

The FBC BHJD Program builds on the success of the FBC Juvenile Probation Department in providing an array of mental health services to youth involved in the juvenile system. The FB BHJD transforms the current service delivery system by expanding the array of services available, implementing and evaluating evidence based interventions, developing data tracking across systems, information sharing, and monitoring outcomes for a targeted population of youth with complex behavioral health needs at risk of involvement or further involvement in the juvenile justice system.

Challenges:

Access to appropriate levels of care will be a challenge. There are limited resources for stabilizing and supporting youth with behavioral health disorders in the community. The FBC

project will address this by engaging with public and private providers of behavioral health services, community organizations, and volunteer groups. For example, FBC will work with MHA of FBC to develop an on-line resource directory with special attention to high risk populations (e.g., youth with complex behavioral health needs). This project will also focus on the expansion of wraparound supports and patient/ family education necessary for keeping youth in the community and development of strength/ protective factors.

The integration of data systems will also be a challenge**.** FBC has well developed data tracking systems but this need to be integrated to facilitate communication regarding patients' needs, linking them to appropriate services and tracking outcomes. The availability of integrated data tracking systems will allow us to continuously identify unmet needs and new resources. The project will work with various partners in the region as well as the county's Information Technology department to develop the most efficient data tracking system. These data elements will be used as part of the project's quality improvement process.

5-year Expected Outcome for Provider and Patients:
FBC expects to see a reduction in the percentage of youth with behavioral health needs that are incarcerated and improved functional status. The project will be county wide and include the following zip codes:

77053	77406	77407	77417	77441	77444
77451	77459	77461	77464	77469	77471
77476	77477	77478	77479	77481	77487
77489	77494	77496	77497	77498	77545

Starting Point/Baseline:
This is a new program; therefore, the baseline for all metrics and milestones will be established after the project is implemented.

Rationale:
Reasons for selecting the project option: 2.13.1 – Design, implement and evaluate research supported and evidence based interventions tailored towards individuals in the target population: youth with complex behavioral health needs involved or at risk of involvement in the juvenile justice system.

Project Components:
Through the FBC BHJD Program, we propose to meet all the required project components below and the selected milestones and metrics that relate to the project components:

a. Assess size, characteristics and needs of target population

FBC BHJD project will expand the assessment of the needs of youth with severe mental illness as well as the factors leading to their involvement with law enforcement.

b. Review literature/ experiences with populations similar to the target population to determine community based interventions that are effective at diverting youth from the incarceration

FBC BHJD project will continue to review literature and evaluate ongoing experiences with youth with complex behavioral health needs that are effective at reducing negative

outcomes, such as incarceration, decreased mental and physical functional status and promoting positive health, social and quality of life outcomes.

c. Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes

FBC BHJD project will develop a project evaluation plan that includes qualitative and quantitative measures to determine project outcomes.

d. Design models which include an appropriate range of community based and residential supports

FBC BHJD project will work with public and private behavioral health providers, community organizations, and others stakeholders to develop an array of community based services for youth with complex behavioral health

e. Assess the impact of the interventions based on standardized quantitative measures and qualitative analysis relevant to the target population

FBC BHJD will develop measurement processes that are based on standardized tools relevant to the target population including the use of the Child and Adolescent Needs and Strengths (CANS).

Milestones & Metrics:

FBC has selected the following process milestones and metrics. These were chosen to ensure core components, some of which have already been fulfilled, are completed and documented appropriately.

- P-1 – Conduct needs assessments of youth with complex behavioral health needs
- P-2 - Design community based specialized interventions for youth to prevent incarceration or re-incarceration and improve functional status
- P-3- Enroll and serve individuals
- P-4 – Evaluate and continuously improve interventions
- P-7– Participate in face-to-face learning (i.e., meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around similar or shared projects.

Since this is a start-up project and these services are not available, all of these milestones/metrics are necessary for a successful project.

The following improvement milestone and metrics were chosen.

1-5.1 : 25% of individuals receiving specialized interventions, through the FB BHJD project, will demonstrate improved functional status on standardized instruments (e.g., CANS) in DY4 and DY5

The Child and Adolescent Needs and Strengths Assessment (CANS) will be used to guide service planning and to evaluate functional status. The CANS will be completed at intake and at regular intervals throughout the project to guide service planning. The CANS post intervention data will be used as an improvement outcome.

How the project represents a new initiative for the Performing Provider or significantly enhances an existing service delivery reform initiative:

This is a new initiative for FBC and will improve response to youth with complex behavioral health needs that are involved with juvenile probation department and / or at risk of involvement.

In addition, this initiative will further the development of needed infrastructures and partnerships to leverage existing resources, develop additional resources based on identified needs, and improve access to care in the community.

Related Category 3 Outcome Measure(s):
The Category 3 Outcome Measure chosen falls within OD-9-Right Care, Right Setting.
Reasons/rationale for selecting the outcome measure(s):
The goal of the FBC project is to divert youth with complex behavioral health needs from incarceration. The Fort Bend County (FBC) Behavioral Health Juvenile Diversion (BHJD) program will focus on the development of specialized interventions and a service delivery system to better identify youth with mental illness and divert them to the appropriate services. This project will interface other FBC proposed DSRIP projects including the Behavioral Health Crisis and Response system. The FBC BHJD program will provide necessary interventions, increase the array of services including diversion services, and as a result reduce incarceration of youth with serious mental illness and other complex behavioral health needs as well as improve the functional outcomes for these youth.

Relationship to Other Projects:
This project will interface with the Behavioral Health Crisis Response and Intervention project proposed by FBC. The project will also interface with the FBC Primary Care Coordination and Primary Care Expansion projects to facilitate access to essential primary care often overlooked for youth with behavioral health disorders.

Relationship to Other Performing Providers' Projects in the RHP: The FBC project will interface with other Performing Provider's (PP's) in the region to ensure access to necessary behavioral health services to prevent juvenile justice involvement and improve functional status of youth with complex behavioral health needs.

Plan for Learning Collaborative:
We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:
Valuation is based on cost avoidance, projecting savings associated with reducing use of Juvenile Detention to manage the target population with regard to mental and behavioral health needs. During DY 4 and DY 5 Fort Bend County will avoid an average of 41 days annually in detention for an average of 23 youth per year. At $400 per day, this will produce a total savings of $754,400.

Project Option 2.3.2: "Other" project option: Implement other evidence-based project to redesign primary- Community Paramedic Program

Unique RHP Project Identification Number: 2967606-01 2.3 / Pass 2

Performing Provider Name /TPI: Fort Bend County Clinical Health Services / 2967606-01

Project Summary:

Provider: Fort Bend County Clinical Health Services is a division of the Fort Bend County Health & Human Services Department (FBCHHS), the local health department for the County. Fort Bend County is located in the Houston metropolitan area of southeast Texas. It encompasses a total of 875.0 square miles (562,560 acres). The current population is estimated at almost 607,000. FBCHHS services include: Animal Services, Clinical Health Services, EMS, Environmental Health, Social Services, Veterans Services and Public Health Preparedness. Fort Bend County also has a Behavioral Health Services program.

Intervention: This project will provide primary care to individuals who call 9-1-1 service for non-emergent conditions. Advanced Practice Paramedics will assess the individuals, provide necessary care and also connect them to the local Federally Qualified Health Center (FWHC) and the patient navigation program proposed in our project 2967606-01 2.1. The project will promote the medical home and serve as a community based navigation system.

Need for the project: While the county population as a whole is wealthy, 8% of the population (48,560) live below the federal poverty level and 19% of the population has no health insurance coverage (>115,000). In one of the county census divisions, more than 17% of the population lives below the federal poverty level. The county has no hospital district and the only health care payment available to the population that does not qualify for Medicaid/Medicare is the Indigent Health Care program which covers only those with an existing medical condition who have an income of less than 21% of the federal poverty level. The program covers up to $30,000 of eligible medical care per year for individuals who qualify for the program, approximately 1,000 per year. In some areas and some populations in the county, when no primary care is available or affordable, the EMS and ED are by default the primary care providers.

Target Population: Uninsured, underinsured or Medicaid covered individuals who do not access primary care and use emergency services in lieu of a medical home.

Patients will receive primary or acute care in their home setting and will then receive the benefit of ongoing assistance with medical care for primary prevention and chronic conditions as well as being linked to needed social services and transportation. Overall health will improve as well as some of the conditions leading to less than optimum health.

Category 2 patient benefit milestones: The program targets a minimum of 225 individuals diverted from high cost EMS transportation and ED visits to the FQHC medical home.

Category 3 outcome measures: IT 9.2 – 25% reduction in ED use in DY 4 and 30% reduction in DY5 in the target population. IT 9.4 - 25% reduction in EMS transport use in DY 4 and 30% reduction in DY5 in the target population.

Project Option 2.3.2: "Other" project option: Implement other evidence-based project to redesign primary- Community Paramedic Program

Unique RHP Project Identification Number: 2967606-01 2.3 / Pass 2

Performing Provider Name /TPI: Fort Bend County Clinical Health Services / 2967606-01

Project Description:

Fort Bend County proposes a project which would identify Indigent Health Care, Medicaid and uninsured patients who are frequent or inappropriate users of the County Emergency Medical Service (EMS) and hospital Emergency Departments (EDs) to provide appropriate care in their home setting using Advanced Practice Paramedics / Community Paramedics. The project will have the following components:

- EMS Dispatch trained to determine nature of call as non-emergent
- Trained Advanced Practice Paramedics / Community Paramedics
- Response vehicles with equipment for treatment at home, but not ALS transport
- Treatment of minor or chronic illness in the home setting
- Transportation to a medical facility if determined necessary
- Coordination with the established medical home for the target population, the FQHC for ongoing management of chronic conditions, primary care, prevention services
- Connection to Social Service agencies for other needs
- Information provide on the call line to assist clients with determining whether they need EMS, ED or an appointment scheduled at the FQHC clinic.

The Community Paramedic Program would be housed with the Fort Bend County EMS department, which is part of Fort Bend County Health & Human Services. The program would be conducted in coordination with the local Federally Qualified Health Center (FQHC), AccessHealth. The FQHC would become the medical home for patients referred after treatment by the Community Paramedic Program.

A partnership of the local de facto indigent care hospital, the Federally Qualified Health Center, the Health Department, Emergency Medical Service, and additional community partners would collaborate on a systematic method of identifying frequent users of the high end medical resources who are covered by Medicaid, Medicare, or the County Indigent Health Care program or who are self-pay. These patients would be eligible for management through the Community Paramedic Program. This program will be modeled after successful community primary care APP programs in the United Kingdom[2], Australia[3], Wake County, North Carolina[4] and Tarrant County, Texas[5].

The aim is to provide necessary primary care on scene, avoid an expensive EMS transport and ED visit and also be the link in to the Care Management system at the Federally Qualified Health Center. As reported by other programs established in communities, the program can

reduce the probability of providing acute emergency medical care for at risk patients and the medically underserved, thereby reducing unnecessary health care expenditures, and increase the outreach activity and education components of EMS.

Target Zip codes for the program are:

77053	77406	77407	77417	77441	77444
77451	77459	77461	77464	77469	77471
77476	77477	77478	77479	77481	77487
77489	77494	77496	77497	77498	77545

Goals and Relationship to Regional Goals:

The goal of this project is to provide a coordinated program of patient centered needs resolution, community to medical home connection, and evaluation of program success in a rapid cycle improvement method. The proposed project will add Advanced Practice Paramedics to the local EMS. The goals include:

- Reduction in use of high end medical resources such as EMS and EDs
- Increase in the number of medically indigent, uninsured, and Medicaid eligible clients who have access to primary care and a medical home, prevention services and chronic disease management
- Improvement in health for those patients who are identified as frequent users of high end resources for non-emergent care.

The project meets the following regional goals:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system.

Challenges:

The populations that this project seeks to serve have established patterns of behavior that are not conducive to improved health or to cost effective use of existing medical resources. As with any intervention that seeks to change current behavior, the project will need to be patient centered and be flexible to encourage the change in behavior that is desired. Data collection for baseline and rapid cycle evaluation will need to come from a variety of providers and agencies and will need a systematic collection methodology.

5-year Expected Outcome for Provider and Patients:

Fort Bend County expects to see decreases in use of the ED and EMS for non-urgent conditions, to see improvements in health status of the targeted population in terms of clinical markers, follow up with appointments and medications or other interventions and an improvement in recognition of available community resources and the concept of a medical home for all.

Starting Point/Baseline:

Baseline data is not established, although the EMS and EDs have some data points as background rationale for the project. Data will be gathered on past and current users of the EMS system, hospital EDs and the Fort Bend County Indigent Care program for non-emergent and for frequent users of the high-end resources to establish the starting point for the proposed program. In the first six months of the program, data gathering systems will be put in place to monitor the successful treatment, referral, engagement and outcomes for the patients who are referred in, using a rapid cycle improvement method.

Rationale:

Reasons for selecting the project option:

Fort Bend County does not have a hospital district structure for indigent healthcare or for the uninsured and underinsured population of the County. The County participates in the state mandated Indigent Health Care Program which provides care for qualifying individuals whose income is below 22% of the Federal Poverty Level. With a population estimate of 606,000, there are more than 48,500 (8%) individuals living below the Federal Poverty Level and up to 115,140 uninsured at this time in the County[1]. For these individuals, medical care is often beyond their economic reach. Cash payment options and even sliding scale fees take lower priority than housing payments and food. One of the ways that the indigent population of the County avoids payment up front is to utilize the EMS 9-1-1 response system to obtain a "free" ride to the hospital, to receive priority care in the Emergency Department because of EMS transport and to not have a co-pay on site at the hospital.

Data from the local hospital handling the majority of indigent or uninsured/ underinsured clients in the county, shows that more than two thirds of the ED visits in 2011 were not of an emergent nature. In addition, of the approximately 10,000 patients seen in the first half of this year, 20% were Medicare enrollees, 37% Medicare and Medicaid managed care, and 1% county indigent health care. The remaining 42% are self-pay of which the majority have no means to pay for their health care.

Along with the use of expensive EMS and ED services for non-emergent illnesses, is the use of these same resources for chronic conditions which could better be managed and controlled in an outpatient setting and using a medical home approach. Barriers to patients voluntarily seeking this option include lack of knowledge and understanding of their own medical conditions

and of the resources available, lack of transportation, inability to pay fees and available hours for care.

The County Indigent Health Care program currently focuses on the need for care once an illness has developed and does not include a preventive or chronic care model.

When a patient is provided stabilization care by the County EMS department and then refuses transportation to the hospital, valuable continuing care coordination and follow-up is lost. A study of frequent users of the County EMS service showed 15,000 patients with more than three uses of the EMS service in a span of 18 months. The highest number was 20 calls in 18 months. The highest number of calls for one individual in the calendar year 2011 was 16 calls, but one individual has already reached 18 calls in the first 8 months of 2012.

Project Components:

Project option 2.3.2 does not have required components. Other project components:

- Development of an Advanced Practice Paramedic/Community Paramedic program to provide primary care in the community when individuals are attempting to use EMS and ED resources for non-emergent conditions and chronic condition stabilization.
- Ensure coordination of the Community Paramedic Program with the FQHC and Social Service agencies within the community to allow for ongoing coordination of care and resolution of other needs.

Milestones and Metrics:

Process Milestones and Metrics

P-X. Milestone: Conduct a needs assessment to identify the patient population(s) to be

targeted with the Patient Navigator program. (Metric P-X.1)

P-XX. Milestone: Provide primary care to individuals with non emergent needs who call the 9-1-1 EMS for non-emergent conditions or chronic condition stabilization, and referral services to the targeted patients. (Metric P-XX.1)

P-XXX. Milestone: Provide reports on the types of care provided to patients using the Community Paramedic Program. (Metric P-XXX.1)

P-12. Milestone: Participate in face-to-face learning (i.e. meetings or seminars) at least twice

per year with other providers and the RHP to promote collaborative learning around

shared or similar projects. (Metric P-12.1)

Improvement Milestones and Metrics

I-X. Milestone: Reduce number of EMS transports for patients managed by the Community Paramedic Program (Metric I-X.1

I-XX. Milestone: Reduce the number of inappropriate ED visits for patients managed by the Community Paramedic Program. (Metric I-XX.1)

Unique community need identification number the project addresses:

- CN.8 High rates of inappropriate emergency department utilization
- CN.9 High rates of preventable hospital admissions
- CN.11 High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease
- CN.21 Inadequate transportation options for individuals in rural areas and for indigent/low income populations

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

This project uses a proven community paramedic program concept to reduce the burden on over utilized high end resources such as EMS transport and ED care, while offering primary and chronic care management in the home setting. The project also brings patients into a care coordination system and medical home for ongoing management which can lead to improved health outcomes and reduction in episodic and disease driven encounters with EMS and the ED.

Related Category 3 Outcome Measures:

OD-9 Right Care, Right Setting (IT 9.2 – ED Appropriate Utilization / Reduce ED use in target population managed by the Community Paramedic Program)

OD-9 Right Care, Right Setting (IT 9.4 – Other Outcome Improvement Target / Reduce EMS transport use in target population managed by the Community Paramedic Program)

Reasons/Rationale for selecting the outcome measures:

The population that will benefit from the proposed Community Paramedic Program is the indigent or uninsured population with episodic or chronic health conditions. A determined need is to reduce the use of high cost medical resources such as ED and EMS for non-urgent and chronic conditions. The two outcome measures seek to determine whether the project is reaching this goal in the targeted population.

Relationship to other Projects: This project supports the Chronic Disease registry ED diversion projects proposed by our partners, the local hospital authority, and the FQHC. In addition, it will support the Care Coordination project proposed in the Pass One submission by Fort Bend County. The intention of each of these projects is to decrease the burden of care on

the EMS and emergency departments as well as to establish an improved coordination of care model for chronic and non-emergent conditions that will improve the health of the individuals involved, resulting in improved clinical outcomes and reduce the cost of care.

Relationship to Other Performing Providers' Projects in the RHP:

Primary Care/Ambulatory Care clinics are a top priority to Region 3 due to the acuity of the regional patient mix, population concentration, and lack of primary care access points for our patient base. The regional approach of collaboration as well as existing patient referral pattern relationships allowed our team to properly identify the community needs based on the necessity of population, uninsured, and medically underserved patient bases. This program is consistent with our region and similar to numerous initiatives in our RHP plan sharing both concepts as well as outcome measures focused to percent improvement over baseline of patient satisfaction scores, reduction of inappropriate ED utilization, and third next available appointment status. The Region 3 Initiative Grid attached as a RHP Plan addendum reflects a grid of relationship for all initiatives.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

This project addresses the top priority identified by the FBC 1115 Access to Care planning group – a system of care for community residents who are medically indigent, uninsured or underinsured. The project aims to reduce EMS and ED use in this population, thereby improving the health of the targeted population by access to ongoing preventive and chronic disease care in a patient centered program as opposed to episodic disease care in high cost resource settings.

Valuation is based on cost avoidance, projecting savings associated with reducing unnecessary EMS and ED use by patients in the target population. Fort Bend County will reduce EMS and emergency room usage during DY 4 and DY 5 by an estimated $1.5 million.

Project Option 2.7.1: Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations– Colonoscopy Screening

Unique RHP Project ID: 2967606-01 2.4 / Pass 2

Performing Provider Name /TPI: Fort Bend County Clinical Health Services/2967606-01

Project Summary:

Provider: Fort Bend County Clinical Health Services is a division of the Fort Bend County Health & Human Services Department (FBCHHS), the local health department for the County. Fort Bend County is located in the Houston metropolitan area of southeast Texas. It encompasses a total of 875.0 square miles (562,560 acres). The current population is estimated at almost 607,000. FBCHHS services include: Animal Services, Clinical Health Services, EMS, Environmental Health, Social Services, Veterans Services and Public Health Preparedness. Fort Bend County also has a Behavioral Health Services program.

Intervention: Through a cooperative project with local health care providers, this project will provide colonoscopy screening to uninsured and underinsured populations who meet the criteria for this procedure. In addition, for those identified with colorectal cancer through this project, the appropriate continuum of care will be provided through cooperative agreements.

Need for the project: While the county population as a whole is wealthy, 8% of the population (48,560) live below the federal poverty level and 19% of the population has no health insurance coverage (>115,000). In one of the county census divisions, more than 17% of the population lives below the federal poverty level. The county has no hospital district and the only health care payment available to the population that does not qualify for Medicaid/Medicare is the Indigent Health Care program which covers only those with an existing medical condition who have an income of less than 21% of the federal poverty level. The program will cover up to $30,000 of eligible medical care per year for individuals who qualify for the program, approximately 1,000 per year. Neither the Indigent Health Care program, nor the Federally Qualified Health Center can provide screening colonoscopies at this time.

Target Population: Uninsured, underinsured and Medicaid covered individuals who meet the criteria for screening for colorectal cancer by colonoscopy. Patients will receive screening colonoscopies and may have cancer prevented by the removal of pre-cancerous lesions. If diagnosed with cancer they will be provided appropriate treatment.

Category 2 patient benefit milestones: The program targets a minimum of 200 individuals who meet the criteria for colorectal screening by colonoscopy but who have no means to cover this procedure. Of this group, some will receive polypectomies for pre-cancerous polyps, thus preventing cancer. Some may be diagnosed and treated for cancer.

Category 3 outcome measures: IT-6.1: 40% increase in patient satisfaction in regards to their access to a medical specialist and in shared decision making. IT 12.3: 100% increase in the number of screening colonoscopies performed in the target population.

Project Option 2.7.1: Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations– Colonoscopy Screening

Unique RHP Project ID: 2967606-01 2.4 / Pass 2

Performing Provider Name /TPI: Fort Bend County Clinical Health Services/2967606-01

Project Description:

Fort Bend County proposes a project where Indigent Health Care, Medicaid and uninsured patients who meet guidelines for screening or diagnostic colonoscopies are referred to a local medical provider for this procedure. Under contract with Fort Bend County Clinical Health Services, the local medical provider (negotiations underway) would provide the following:

- Instructions on preparation for the procedure, including prescriptions if needed
- Appointment scheduling for the procedure
- Coverage of the anesthesia, colonoscopy procedure and pathology, if required
- Acceptance for cancer surgery, radiation and/or chemotherapy for a patient diagnosed with colon/rectal cancer at a contracted rate.

The population of uninsured and underinsured individuals in Fort Bend County does not currently have access to low cost or no cost colonoscopies. The Federally Qualified Health Center (AccessHealth) can only provide Fecal Occult Blood (FOBT) testing and has no referral source for colonoscopies for those without insurance coverage or without means to pay. The County Indigent Health Care Program can only provide payment for services to those who are below 21% of the federal poverty level and who already have a health condition such as a positive FOBT or other medical indication of need. Preventive screening is not covered.

The project will include education to the target population through AccessHealth and other points of contact with this population about colorectal cancer, the importance and benefits of screening and the availability of the new project to make this available.

Target Zip codes for the program are:

77053	77406	77407	77417	77441	77444
77451	77459	77461	77464	77469	77471
77476	77477	77478	77479	77481	77487
77489	77494	77496	77497	77498	77545

Goals and Relationship to Regional Goals:

The goal of this project is to provide evidence-based prevention for colon and rectal cancers in the uninsured and underinsured population of Fort Bend County. The expected outcomes include:

- prevention of colorectal cancers by the removal of precancerous polyps
- reduction in cost and increase in cures by early detection of colorectal cancer.

The project meets the following regional goal:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.

Challenges:

The populations targeted by this program currently have no available low cost or no cost option for screening or diagnostic colonoscopies. One challenge will be the education of the population that this service is now available to them and why it is important. A second major challenge will be if the percentage of the patients who are screened and are diagnosed with cancer is higher than anticipated. This will place a higher burden on the contracted entity than planned based on current population estimates of colorectal cancers.

5-year Expected Outcome for Provider and Patients:

Fort Bend County expects to see increases in the number of uninsured and underinsured who are able to take advantage of the screening recommendations for colorectal cancer. In addition, any patient whose screening results in a need for further medical treatment will be able to complete the needed treatment under contractual agreement between the performing provider and a local medical provider.

Starting Point/Baseline:

Baseline data is limited to the Texas Department of State Health Services surveillance for colorectal cancer morbidity and mortality, as noted below. During the planning stage of the program, local data from health care providers will be gathered to enhance the state provided data. In the first six months of the program, data gathering systems will be put in place to monitor the successful referral, engagement and outcomes for the patients who are referred in, using a rapid cycle improvement method.

Rationale:

Reasons for selecting the project option:

Fort Bend County does not have a hospital district structure for indigent healthcare or for the uninsured and underinsured population of the County. The County participates in the state mandated Indigent Health Care Program which provides care for qualifying individuals whose income is below 22% of the Federal Poverty Level. With a population estimate of 606,000, there

are more than 48,500 (8%) individuals living below the Federal Poverty Level and up to 115,140 uninsured at this time in the County[1]. For these individuals, medical care is often beyond their economic reach. Cash payment options and even sliding scale fees take lower priority than housing payments and food. Expensive screening and diagnostic colonoscopies are beyond the reach of the majority of these individuals.

Data shows that the current incidence rate for Colon and Rectal cancer in Fort Bend County is 38.6 per 100,000 population, and the death rate is 15.5 per 100,000[2]. Even without assuming that the incidence and death rate is higher in the uninsured and underinsured (therefore unscreened) population, these rates would result in 44 cases of colorectal cancer and 18 deaths due to this cancer in the uninsured population of Fort Bend County.

Project Components:

Project Option: 2.7.1 does not have required components.

Milestones and Metrics:

Process Milestones and Metrics

P-1. Milestone: Development of innovative evidence-based project for targeted population.

Metric P1.1: Document Innovational Strategy and Plan

a. Data Source: Documentation of meetings and discussion leading to contract for colonoscopy services.
b. Rationale/Evidence: Meeting minutes, preliminary program designs, contract for services

P-2. Milestone: Implement evidence-based innovational project for targeted population.

Metric P2.1: Document implementation strategy and testing outcomes

a. Data Source: Program protocols and procedures, Numbers of colonoscopies performed and outcomes
b. Rationale/Evidence: To identify, develop and test new models of healthcare delivery and disease management lays the groundwork for widespread adoption of innovative care that can lead to a system that delivers better health, better care at reduced costs.

P-7. Milestone: Participate in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. (Metric P-8.1)

Improvement Milestones and Metrics

I-7. Milestone: Increase access to disease prevention programs using innovative project option

Metric 1.7.1: Increase percentage of the target population reached

a. Numerator: Number of individuals of target population reached
b. Denominator: Number of individuals in the target population
c. Data Source: documentation of outreach, education and referrals in the target population
d. Rationale/Evidence: Success/failure of outreach, education, adoption of screening program

Unique community need identification number the project addresses:

- CN.1 Inadequate access to primary care
- CN.2 Inadequate access to specialty care

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

This project is based in the evidence of cancer prevention and successful treatment resulting from appropriate and early screening for colorectal cancers, which is currently not available to the uninsured and underinsured population in our County. At this time, there is no referral available for screening and very limited availability of treatment resource or payment options for diagnosed colorectal cancer.

Related Category 3 Outcome Measures:

OD-6 Patient Satisfaction (IT-6.1 – Patient Access to Specialist, Shared Decision Making)

OD-12 Primary Care and Primary Prevention (IT-12.3 – Colorectal Cancer Screening)

Reasons/Rationale for selecting the outcome measures:

The target population has limited access to specialist care and valuable data can be gathered from the survey regarding their satisfaction with and experience with the specialist and also as to whether they feel a part of the process in deciding what will happen in their health care plan as they access resources not previously available to them. The measurement of the numbers of colonoscopies performed per targeted population will measure the success of the project in reaching and engaging the target population in prevention of a serious health issue.

Relationship to other Projects: This project supports and enhances the Expand a Patient Navigation system project that is proposed in the Fort Bend County pass one project. The medical home and patient navigation system will now have a resource to refer patients to for primary prevention and treatment of a curable cancer.

Relationship to Other Performing Providers' Projects in the RHP: The increase of primary care and specialty care will naturally result in additional ambulatory care encounters for our region patient base. The ambulatory initiatives cover items such as laboratory, PT/OT, social work, etc. and are a necessity of our patients to ensure a comprehensive treatment for access as

well as cost avoidance. The Region 3 initiative grid in the addendum reflects all ambulatory operations initiatives.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Valuation is based on cost avoidance, projecting savings associated with prevention of a life threatening disease and potentially detecting the cancer early enough from rapid and successful treatment. At an average annual cost of $3,000 for co-morbidity treatment. The cost savings of early detection and treatment over five years is estimated at $600,000.

Gulf Bend

Pass 2

Project Option2.15.1-Integrate Primary and Behavioral Health Care Services: Person-Centered Behavioral Health Medical Home

Unique RHP Project Identification Number: 1352544-07.2.1/Pass 2
Performing Provider Name/TPI: Gulf Bend Center / 1352544-07

Project Summary:
Provider - Gulf Bend Center is the Community Mental Health Center located in Victoria, Texas. Gulf Bend Center provides services to individuals in the following seven county area: DeWitt, Lavaca, Jackson, Goliad, Victoria, Calhoun, and Refugio. Gulf Bend Center's Local Service Area has a population of approximately 200,000. Today, Gulf Bend Center is funded to serve an average 608 unduplicated adults per year. The Center currently reaches 1,800 adults a year with the help of local contributions, foundation grants and other forms of resource leveraging.
Intervention: Develop and implement a Person-Centered Behavioral Health Medical Home in Port Lavaca, TX. The center will target at risk populations with co-morbid diseases of mental illness and chronic disease who currently go untreated or under treated and who routinely access more intensive and costly services. The person-centered behavioral health medical home will offer behavioral health services, primary care services, health behavior education & training programs, long & short term care for those with mental illness and co-occurring chronic disease and case management services to help patients navigate the services in the same location.
Need for project: The need for this project was based upon data for Victoria County from the Texas Department of State Health Services for preventable hospitalizations from diabetes, asthma, and COPD with a coexisting behavioral/mental health disorder. The data showed:

- Between 2005 and 2010, there were 48 hospitalizations for diabetes complications that totaled $2,170,723 in charges. Using national statistics, we can conclude that of those 48 hospitalizations, that 15 had a co-occurring mental illness. If those 15 patients had access to integrated care, it would have lead to a cost savings of $678,345[222]
- Further data from Memorial Medical Center shows that 231 individuals were seen in the Emergency Department in 2011 with a primary behavioral health diagnosis. Using national statistics, of those 231 individuals, 157 had a co-occurring chronic disease.

Target population: The target population are the at risk populations with co-morbid diseases of mental illness and chronic disease.
Category 1 expected benefits: The project seeks to decrease inpatient and ED admissions for co-occurring mental illness and chronic diseases, lower the costs of providing care, and providing greater access to primary care for those with co-occurring mental illness and chronic diseases.
Category 3 outcomes: IT-2.4: Behavioral Health/Substance Abuse Admission Rate

- One for BH/SA as the principal diagnosis
- A secondary category in which a significant BH/SA secondary diagnosis is present (i.e. reduction in admission rate with a primary diagnosis of diabetes/COPD with a secondary diagnosis of mood/affective disorders.)
  Gulf Bend will attempt to decrease admissions due to diabetes and COPD with an underlying or co-existing mental health disorder by 0% by the end of DY 5.

[222] Per DSHS, the average hospital charge for a diabetes admission in Calhoun County from 2005 to 2010 was $45,223

Project Option2.15.1-Integrate Primary and Behavioral Health Care Services: Person-Centered Behavioral Health Medical Home

Unique RHP Project Identification Number:1352544-07.2.1/Pass 2
Performing Provider Name/TPI: Gulf Bend Center / 1352544-07

Project Description:
This project will integrate behavioral health and primary care services in a clinic operated by Gulf Bend Center in Calhoun County, Texas where access to these services is limited by geographical and socioeconomic barriers.

The goal of this project is to develop and implement a Person-Centered Behavioral Health Medical Home, targeting at risk populations with co-morbid diseases of mental illness and chronic disease who currently go untreated or under treated and who routinely access more intensive and costly services, such as emergency departments or jails.
This project proposes a solution by offering a site that will integrate primary care into the behavioral health services that Gulf Bend already provides in its service region, which includes the counties of DeWitt, Lavaca, Jackson, Goliad, Victoria, Calhoun, and Refugio. The person-centered behavioral health medical home will offer the following services in the same location:

1. Behavioral Health Services
2. Primary care services
3. Health behavior education and training programs
4. Long and short term care for those with mental illness and co-occurring chronic disease
5. Case Management services to help patient navigate the services provided in the community.

Clients will receive proactive, ongoing behavioral health services that keep them healthy and empower them to self-manage their conditions in order to avoid their health worsening and needing ED or inpatient care.

Goals and Relationship to Regional Goals:
The goals for this project include:

- Increase in access to primary care
- Increase in access to behavioral health care services
- Reduction in inpatient psychiatric hospitalizations
- Implement the IMPACT model of integrated collaborative care
- Increase in patient satisfaction
- Reduction in Emergency Department visits
- Chance to develop and change health behaviors
- Reduction in preventable behavioral health and chronic disease hospitalizations

This project meets the followingregional goal(s):
Improving the health of our region by expanding and coordinating access to patient-centered primary care and behavioral health care services that includes health promotion and disease prevention.

Challenges:
Gulf Bend will face several challenges in opening and operating a satellite behavioral health clinic in Calhoun County. The first challenge will be determining the best location within Calhoun County to provide these services. To meet this challenge, Gulf Bend will engage city and community official and stakeholder input as to the best location for the new clinic. The second challenge will be determining the correct staff and staffing ration to be efficient in delivering behavioral health services at the satellite clinic. Gulf Bend feels that this challenge can be overcome by researching and engaging other community health centers for a solution to this challenge. The third, and final, challenge will be operating a clinic that will be located 45 minutes away. Gulf Bend will meet this challenge by hiring a clinic manager, who will be responsible for the day to day operations of the clinic.

5-Year Expected Outcome for Provider and Patients:
The five year expected outcome through the development and implementation of the Person-Centered Behavioral Health Medical Home project is to provide critical services to the targeted population with co-morbid diseases of mental illness and chronic disease that currently go untreated or under treated. Through the delivery of integrated medical and behavioral health care we expect to see individuals with a treatment plan developed and implemented with delivery provided by those with primary care and behavioral health expertise. We also expect to see an overall reduction in costs and an increase in the overall satisfaction and health and well-being of this population.

Starting Point/Baseline:
Gulf Bend Center currently provides behavioral health services for primarily indigent or Medicaid-eligible clients who have schizophrenia, bipolar disorder, and major depression in its Victoria County location. Gulf Bend Center's Local Service Area has a population of approximately 200,000. Using national statistics we can conclude approximately 50,000 individuals have some form of mental illness of which 34,000 likely have a medical and/or chronic disease. Today, Gulf Bend Center is funded to serve an average 608 unduplicated adults per year. The Center currently reaches 1,800 adults a year with the help of local contributions, foundation grants and other forms of resource leveraging. Currently, 10% of Gulf Bend clients reside in Calhoun County. Of the 97 clients, 78 are adult and the remaining 19 are children/adolescents.

Rationale:
Gulf Bend selected this project because of the critical need for these services, which was based upon national and local data. Co-occurring mental and physical health issues are common in the general population but are significant for persons with serious mental illness. National statistics demonstrate on average more than 68% of adults with a mental disorder had at least one medical condition, and 29% of those with a medical disorder also had a mental health condition. People with schizophrenia and bipolar disorder are up to three times more likely to have three or more chronic conditions compared to people without these disorders. Research has shown that those patients affected by mental illness and suffering from chronic disease are dying 25 years earlier than the rest of the population[223].

[223] Freeman, E, Yoe, J. The Poor health status of consumers of mental healthcare: Behavioraldisorders and chronic disease, Presentation to NASMHPD Medical Directors Work Group,May 2006.

There is a demonstrated community need in Calhoun County for this project. Texas Department of State Health Services data showed alarming rates of chronic disease and preventable hospitalizations based upon data from 2005 to 2010. Between 2005 and 2010, there were 48 hospitalizations for diabetes complications that totaled $2,170,723 in charges. Using national statistics above, we can conclude that of those 48 hospitalizations, that 15 had a co-occurring mental illness. If those 15 patients had access to integrated care, it would have lead to a cost savings of $678,345[224]. Further data from Memorial Medical Center shows that 231 individuals were seen in the Emergency Department in 2011 with a primary behavioral health diagnosis. Using national statistics, of those 231 individuals, 157 had a co-occurring chronic disease. Research has shown that patient centered medical homes that use the IMPACT model of collaborative care have lead to improved outcomes in physical health, benefited various populations and have provided a lower cost of long term health care services[225]. Druss and colleagues conducted a randomized trial of patients within the Veterans Administration system in 2001. In the study, individuals living with serious mental illnesses were to receive primary care in an integrated behavioral health-primary care patient focused model of care. The study showed that individuals were significantly more likely to have made a primary care visit, had a greater mean number of primary care visits, were more likely to have received 15 of 17 preventive measures, and had a significantly greater improvement in their health[226]. Research has shown that the integration of primary care and behavioral health services in the same service location has increased outcomes for those suffering from mental illness and co-occurring chronic disease. A reason for these improved outcomes is due to the fact that integrated care offers "one-stop shopping" for its patients. Data from the Bureau of Primary Care shows that only 1 in 4 patients referred for mental health or chronic disease management make the first appointment. The same research further showed that co-location of integrated primary care services and behavioral health services resulted in improved behavioral health and chronic disease outcomes and proved to provide cost savings.

Several studies have shown the effectiveness of integrated patient centered homes for those suffering from co-occurring co-morbid diseases. On study performed in Texas showed that using an integrated collaborative care site using the IMPACT model of care enhanced access to mental health services, improved quality of life, reduced the occurrence of depression and anxiety, decrease in the utilization of unnecessary emergency department services, and a reduction in overall health care costs[227]. In the study, researchers found that anxiety scores fell by 50%, emergency department use decreased by 50%, and the average health care cost per enrolled decreased by 17% in the second year and 56% in the third year of the program. This data is significant because the targeted patient population size is similar in the Gulf Bend area. There is another benefit to an integrated collaborative care site. The other benefit of an integrated approach that will help reduce the number of admissions is long-term compliance. In 2000, researchers found that patients that receive care in an integrated care site show a higher level of adherence and retention in treatment. This translates into an overall decrease in hospital

[224] Per DSHS, the average hospital charge for a diabetes admission in Calhoun County from 2005 to 2010 was $45,223

[225] http://www.impact-uw.org/about/research.html

[226] Druss, B et al. Integrated medical care for patients with serious psychiatric illness. *Archives of General Psychiatry*, Vol 58, September 2001

[227] Watt T. A Process and Outcome Evaluation of Two Integrated Behavioral Health Care Models: People's Community Clinic and Lone Star Circle of Care. Year-Three Final Report.Texas State University. Fall 2009

admissions. This is because the patient only has to travel to one location for their behavioral and physical health services and has increased access to those services.
The research and data shown above provides evidence that Gulf Bends Category 2 project will have a significant impact and help achieve its selected Category 3 outcome measure. Gulf Bend will be integrating primary care into its existing behavioral health services and will therefore be able to reduce admissions of those affected with co-occurring co-morbid disease.

Project Components: We propose to meet all of the required core project components as follows:

a) Identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community. This will be accomplished through community stakeholder meetings. A site will be chosen that will increase access to the integrated services based upon community need and resources, as well as the needed space requirements. Gulf Bend will secure a long term lease to meet this goal.

b) Develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated through stakeholder meetings on a weekly or monthly basis.

c) Establish protocols and processes for communication, data-sharing, and referral between behavioral and physical health providers based upon evidence based best practice models, such as the IMPACT model of collaborative care.

d) Recruit a number of specialty providers (physical health, mental health, substance abuse, etc) to provide services in the specified locations based upon community and clinic needs, as well as analysis of unduplicated patient visits. Gulf Bend will use provider recruiting and staffing agencies, postings on national association websites, and journals to recruit the needed providers.

e) Train physical and behavioral health providers in protocols, effective communication and team approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include:
    - Regular consultative meetings between physical health and behavioral health practitioners;
    - Case conferences on an individualized as-needed basis to discuss individuals served by both types of practitioners; and/or
    - Shared treatment plans co-developed by both physical health and behavioral health practitioners.

This will be accomplished by holding weekly or semi-weekly meetings between providers and support staff to make sure that collaborative care is used.

f) Acquire data reporting, communication and collection tools (equipment) to be used in the integrated setting, which may include an integrated electronic health record system or participation in a health information exchange – depending on the size and scope of the local project. Gulf Bend will pursue the implementation of an EHR that will allow ease of use when sharing a patient’s health information and medical records among providers.

g) Explore the need for and develop any necessary legal agreements that may be needed in a collaborative practice through the advice and use of Gulf Bend's legal counsel.

h) Arrange for utilities and building services for these settings by calling the utility company within Port Lavaca.

i) Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual

treated in these integrated service settings. The collection methods and reporting mechanisms will be based upon a best practice model from an organization that has already implemented integrated health care.

j) Conduct quality improvement for project using methods such as rapid cycle improvement. Gulf Bend currently has a Quality Improvement board made up of several members of the executive management team and quality management staff. The QI board will develop and implement quality practices for the integrated care based upon evidence based best practice *methods.*

Unique community need identification numbers the project addresses:
The primary care/behavioral health integration proposed in this plan relates to community needs CN.1,CN.3, CN.5, CN.6, CN.7, CN.8, CN.9, CN.10, CN.11, CN.18, CN.20, CN.23,

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative: In Gulf Bend's service region, integrated care sites do not exist. This integrated medical home presents a new, more efficient, project that will begin to treat the person as a whole. The behavioral health and primary care system in the region currently operate in silos with lack of care coordination and communication among behavioral health and primary care providers. This results in less than favorable health outcomes for those with co-occurring chronic disease and mental illness. The integrated care site operated by Gulf Bend will be the first of its kind and will have a positive impact upon the residents of Calhoun County.

Related Category 3 Outcome Measure(s):OD-2 Potentially Preventable Admissions - IT-2.4 Behavioral Health/Substance Abuse Admission Rate

1. One for BH/SA as the principal diagnosis
2. A secondary category in which a significant BH/SA secondary diagnosis is present (i.e. reduction in admission rate with a primary diagnosis of asthma/diabetes/COPD with a secondary diagnosis of mood/affective disorders.)

Gulf Bend will attempt to decrease admissions due to diabetes and COPD with an underlying or co-existing mental health disorder by 10% by the end of DY 5.

Reason/rationale for selecting the outcome measure: Using the above statistics from national, state, and local data sources, there is a community need to prevent admissions in hospitals in Calhoun County for co-occurring co-morbid diseases. The integrated delivery of care will help prevent these admissions and help reduce the overall cost of providing health care to these patients.

Relationship to Other Projects: This project is related to all initiatives designed to support Primary and Behavioral Health Services redesign for improved patient satisfaction and access to care. Its focus and emphasis on improving patient experience, outcomes, coordination of care and access to specialty services will enhance and support many projects within the region, particularly those projects designed to improve access to care and reduce inappropriate ED utilization, including the following: 020973601.1.4 – Expand the number of community based settings where behavioral health services may be delivered in underserved areas; 1352544-07.1.1 (RHP 4 project) – Development of behavioral health crisis stabilization services as alternatives to hospitalization; 121775403.1.6 – Development of a crisis stabilization/urgent care

center to provide screening and assessments to determine the appropriate level of care, and 121990904.2.1 – Integrate primary and behavioral health care services. Related category 4 measures include potentially preventable admissions measures in RD-1.3, and Patient Satisfaction in RD-4.1, and Potentially Preventable Readmissions in RD -2.

Relationship to Other Performing Providers' Projects in the RHP: The cohabitation of primary care and behavioral health is an important focus of our region in order to treat the patient base with comprehensive physical and behavioral healthcare issues. There are multiple initiatives in our RHP plan that address this need and all can be found on the Region 3 Initiative Grid in the addendums. The outcome measures focused to screening measures and access of the patient base. This project will provide coordination of efforts with LMHAs that will result in great learning opportunities. Through the learning collaborative, we will work with other community entities to discuss challenges, lessons learned and obstacles to delivery. The collaborative will provide an ideal learning opportunity and sharing of ideas. Other providers with similar projects with whom we will collaborate and share information include Corpus Christi Medical Center, Bluebonnet Trails Community Mental Health Center, Coastal Plains Community Center and DeTar Healthcare System

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's healthcare system.

Project Valuation:

Gulf Bend considered several factors in valuing this project including reductions in costs associated with emergency room visits and hospitalizations for diseases and illnesses. Improving the physical health of behavioral health clients should reduce the number of ED visits and the occurrences of hospitalizations. The average cost of an ED visit in Gulf Bend's area is $1,265; average cost of a cardiology-related hospital stay is about $16,000.

The decrease in costs due to a decrease in hospital admissions is not the only costs determining factor used in this valuation. One valuation was the affect on the patient themselves. Due to these services, Gulf Bend feels that healthier individuals will have a longer and more productive life span. Those persons with mental illness and co-occurring chronic disease have a lifespan of 25 years less than those who do not have a co-occurring mental illness. Since patients will receive the needed primary care services and studies have shown that compliance is increased, Gulf Bend expects these patients to be able to be more productive and help contribute to the overall benefit of society. Studies have shown that depression is the leading cause of a decrease in productivity in the work place. If the integration of services were to help increase the productivity of patients suffering from a mood disorder and co-occurring chronic disease then the community will benefit as a whole.

Pass 1

Project Option 2.5.4- "Other" project option: Implement other evidence-based project that will impact cost efficiency in an innovative manner: Ambulatory Care Central Fill Pharmacy

Unique RHP Project ID: 133355104.2.1 / Pass 1

Performing Provider Name/TPI: Harris Health / 133355104

Project Summary:

Provider: Harris Health System is comprised of 16 community health centers, seven school-based clinics, a dental center, dialysis center, five mobile health units, one outpatient specialty services clinic, and three hospitals. With a tax base of $511.6 million, Harris Health System was able to provide more than $1.254 billion in charity care during FY 2012.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 35,343 Births (babies delivered)- 6,643 Emergency visits- 173,263 Outpatient clinic visits- 1,054,770	Self-Pay- 62.6% Medicaid and CHIP- 23.4% Medicare- 8.6% Other Funding- 3.6% Commercial Insurance- 1.8%	Hispanic- 57.4% African American- 26.3% Caucasian- 9.2% Asian- 4.8% Other- 2.2% American Indian- 0.2%

This project will create an automated ambulatory central fill pharmacy to facilitate dispensing up to 10,000 prescriptions per shift with a 24 hour turnaround time and mail order capability.

Need for the project:

Currently, Harris Health System has no automated prescription counting technology. Annually, 2.5M prescriptions are counted manually, using only a counting tray and spatula. A Central Fill facility will provide efficiencies in conjunction with the existing ePrescribing system to improve the patient's pharmaceutical experience by improving safety, wait times, turnaround times, access, and convenience.

Target Population:

All patients with prescription medications within the system with may benefit from this project (Medicaid and CHIP-23.4% / Self-Pay- 62.6%).

Category 1 or 2 expected patient benefits:

Our goal is to increase to 50% of total monthly prescription volume from established baseline of 0% prescriptions filled at central fill facility (based on 2.5M annual prescription volume) in DY4 and increase to 60% (1.5M annual) in DY5.

Category 3 outcomes:

IT-5.1: Our goal is to decrease the average labor cost per prescription 7% from established baseline in DY3 (based on 2.5M annual prescription volume), 19% in DY4, and 31% in DY5.

Project Option 2.5.4- “Other” project option: Implement other evidence-based project that will impact cost efficiency in an innovative manner: Ambulatory Care Central Fill Pharmacy

Unique RHP Project ID: 133355104.2.1 / Pass 1
Performing Provider Name/TPI: Harris Health / 133355104
Project Description:

Harris Health proposes to create an automated ambulatory central fill pharmacy to facilitate dispensing up to 10,000 prescriptions per shift with a 24 hour turnaround time and mail order capability.

Currently, Harris Health System has no automated prescription counting technology. Annually, 2.5M prescriptions are counted manually, using only a counting tray and spatula. Central Fill automation will include robotics which will count and dispense the pills into a prescription container, label and cap the prescription container, and sort and package the prescriptions for delivery to the patient or local pharmacy. A Central Fill facility will provide efficiencies in conjunction with the existing ePrescribing system to improve the patient’s pharmaceutical experience by improving safety, wait times, turnaround times, access, and convenience. Central Fill automation will provide 99.99% prescription dispensing accuracy for improved medication safety. Prescription mail order will provide increased access, convenience, and satisfaction because many of our patients have problems with transportation and job related time constraints. Wait times at the on-site pharmacies will be improved by processing the majority of refill prescriptions with a 24 hour turnaround time at Central Fill. The Harris Health Planning Department is currently searching for a suitable location on our existing property. Lease space has also been given consideration. Project managers will consist of an interdisciplinary team of pharmacy, IT, and planning representatives. Future expansion of the Central Fill model is possible at negligible cost due to the efficiencies gained by automation.

Goals and Relationship to Regional Goals:
Project Goals:

- Develop an in-house central fill facility that can process up to 10,000 prescriptions per day with the capability of increasing volume at a negligible cost.
- Increasing the percentage of prescriptions filled by the central fill facility annually.
- Decreasing the average labor cost per prescription from baseline.
- Engineering pharmacy operations to develop a patient centered delivery model ensuring comprehensive medication management for optimal outcomes.
- Enhancing patient satisfaction by decreasing pharmacy wait times and increasing pharmacy access.
- To become a provider of choice for our patients and for the medically underserved individuals and families of Harris County.

- To offer pharmaceutical services to Regional Healthcare Partners as collaborative agreements are formed.

<u>This project meets the following regional goals:</u>

The central fill project will provide the ability for Harris Health to offer pharmacy services to external Federally Qualified Health Centers (FQHC) and/or other regional healthcare partners as collaborative agreements are formed. The project will also provide increased access and patient satisfaction.

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction. The Harris Health Central Fill will improve efficiency in the pharmacy and improve patient satisfaction with improved wait times and patient adherence.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system. The Harris Health Central Fill project will allow on site pharmacists to focus on clinical patient centered activities such as Medication Therapy Management, Refill Clinics and lab monitoring. These programs promote patient adherence and wellness as well as decrease emergency room visits for refills.
- Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes. Automation technology represents best practices currently in use by the Veterans Administration, the United States Armed Services, as well as other public hospitals and retail pharmacy services. Regional collaboration could include Harris Health acting as a contract pharmacy for our regional healthcare partners.

Challenges:

- Funding – this is addressed by the DSRIP project.
- Site location - the site location will be determined by a committee consisting of pharmacy, planning and security representatives. The site will optimally be on Harris Health property or leased if necessary. The Harris Health Planning Department is actively looking for internal space but has also identified potential external lease space.
- Software operating system - the pharmacy software operating system will be transitioned to Epic by mid DY2 which supports central fill.
- Project development – Due to the large scale nature of the project, the central fill DSRIP project will be supported by a multidisciplinary team including; an Information Technology (IT) project manager, Planning project manager and Pharmacy project manager.

5 -Year expected outcome for Provider and Patients:

Through the Central Fill project, Harris Health plans to provide increased efficiency and safety in delivery of pharmaceutical services along with increased access to such services for our patients and regional healthcare partners. Net cost savings are approximately $6.6M through use of automation as compared to the current manual prescription processing. This estimate is based on the current 2.5M prescription volume and will be greater if volume increases with proposed clinic expansions.

Starting Point/Baseline:

Currently, all prescriptions (approximately 2.5M annually) at Harris Health System are manually filled on site by frontline pharmacy staff with no available automation. Patients either wait for their prescriptions or come back at a later date. Efficiency, safety and access would be greatly enhanced with the creation of a central fill facility with mail order capability.

Rationale:

Project option 2.5.4, "Other"project option: Implement other evidence-based project that will impact cost efficiency in an innovative manner, was chosen to justify the pharmacy prescription processing redesign for cost containment. The Harris Health System Department of Pharmacy is committed to providing high quality pharmacy services in the most cost effective and efficient manner through implementation of an in-house central fill facility. The Harris Health System serves approximately 330,000 unduplicated lives, and the Department of Pharmacy currently fills approximately 2.5M prescriptions per year at 16 ambulatory pharmacies located throughout Harris County. Two of the outpatient pharmacies are located within hospitals, and the remaining 14 pharmacies are located within ambulatory clinics. Pharmaceutical services at Harris Health are currently 100% manual. It is expected that approximately 60% of the total Harris Health prescription volume could be efficiently processed by an in-house central fill facility. These medications would consist primarily of maintenance medications for chronic disease conditions. The remaining 40% prescription volume would continue to be filled at the clinic sites and would consist of immediate need medications such as antibiotics, pain medication, antipsychotics, blood pressure and diabetic medications. The in-house central fill processing would afford time for the on-site clinical pharmacists to provide expanded clinical services as physician extenders, such as Medication Therapy Management (MTM), Refill Clinics, and basic lab monitoring. These clinical value added benefits enhance the efficiency and significance of the redesign. Furthermore, the Harris Health System Central Fill Project can easily expand at negligible labor cost to offer pharmaceutical services to our Regional Healthcare Partners as collaborative agreements are formed.

Project Components:

This project does not have required components.

We will improve efficiencies by increasing the percentage of prescriptions filled at the central fill facility.

- There is currently no automation at Harris Health ambulatory pharmacies, therefore the baseline percentage of prescriptions filled at the central fill facility is 0%
- The first partial year consisting of 6 months central fill processing, ending in DY3, is expected to meet a goal of filling 40% of the total monthly ambulatory prescription volume at the facility. This percentage was chosen based on prior Rx.com central fill reports demonstrating a 36% fill rate at the central fill facility. Additional support is based on the fact that the central fill formulary consists primarily of medications used to treat chronic diseases. Approximately 50% of the total ambulatory prescription volume is for refills, and the majority is chronic disease medications.
- In DY4, the percent of prescriptions filled at central fill will increase by 10% to a goal of 50% over baseline. This will be possible by increasing the central fill formulary, centralizing drug replacement program medications and promoting a central fill awareness campaign.
- In DY5, the percent of prescriptions filled at central fill will increase by 10% to a goal of 60% over baseline. Again, this will be possible by increasing the central fill formulary and increasing central fill awareness.

Milestones & Metrics:

- Process Milestones and Metrics: P-X1, P-X1.1; P-7, P-7.1; P-X2, P-X2.1
- Improvement Milestones and Metrics: I-X1, I-X1.1

Unique Community need identification numbers the project addresses:
CN.11 High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease, including cancer, diabetes, obesity, cardiovascular disease, asthma and AIDS/HIV. The prescriptions filled at the central fill facility are primarily refills for chronic disease conditions. The efficiencies gained with this project will allow pharmacists on site, in the clinics and hospitals, to focus on urgent need prescriptions, e.g. antibiotics, pain, seizure medications. On site clinical pharmacists will also have more time to focus on clinical functions such as Medication Therapy Management (MTM), Refill Clinics and basic lab monitoring.

- CN.21 Inadequate transportation options for individuals in rural areas and for indigent/low income populations. The Central Fill project will provide the option for mail order prescriptions. Mail order delivery will enhance access and compliance for our low income patients by relieving transportation, parking and job related issues.
  RHP priority and starting point

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

- An in-house central fill facility is a new initiative for Harris Health System. From August 2008 through December 2011 Harris Health participated in an Alternative Method Demonstration Project (AMDP) approved by Health Resources Services Administration (HRSA) to outsource the filling of prescriptions at a central fill in Fort Worth, Texas. Due to software limitations, the AMDP was discontinued and currently all prescriptions are filled on site. The 2 years with the contracted central fill pharmacy has allowed Harris Health to understand the central fill process in regards to formulary management, workflow, regulatory compliance, reports, record keeping, software and hardware requirements. The lessons learned from outsourcing to a central fill facility will ensure a successful creation of an in house central fill facility.
- The robotics in the central fill facility fill approximately 240 prescriptions per hour as compared to 22 prescriptions per hour filled manually on site. Ten thousand prescriptions may be filled per day at the central fill facility with the option to increase capacity at negligible cost.

Related Category 3 Outcome Measure(s):

OD-5 Cost of Care

IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery

The central fill redesign for pharmacy services at Harris Health will result in cost savings through increased efficiencies in the delivery of pharmaceutical services at Harris Healthy System. Automation will help keep labor costs in check while our frontline staff can focus on clinical efforts for our patients. Pharmacists will be readily available for counseling patients on medication adherence. Offering a mail order delivery option will enhance access and compliance for our low income patients by relieving transportation and parking issues.

We will utilize the Cost Benefit Analysis to demonstrate costs and outcomes in monetary units. We propose incremental cost savings as the project goes from zero automation at baseline in DY2 to 60% automation by the end of DY5. We expect to decrease the average labor cost per prescription by 7% by the end of the initial DY3 implementation year. In DY4, we expect a 19% decrease from baseline in the average labor cost per prescription. In DY5, we expect a 31% decrease from baseline in the average labor cost per prescription. We will use a report to be generated from the new software operating system to determine the percentage of prescriptions filled at the central fill facility. The monthly operating statements will be used to show comparative cost savings in total salaries and benefits and the total number of prescriptions filled at Harris Health. Projected cost savings are based on current 2.5M annual prescription volume.

Relationship to other Projects:

The increase of primary care and specialty care will naturally result in additional ambulatory care encounters for our region patient base. The ambulatory initiatives cover items such as laboratory, PT/OT, social work, etc. and are a necessity of our patients to ensure a comprehensive treatment for access as well as cost avoidance. The Region 3 initiative grid in the addendum reflects all ambulatory operations initiatives.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

This project is a supporting pillar for one of the main objectives of the 1115 Waiver; increasing access to primary care for the underserved population in Harris County. The value of the project is based on cost avoidance, projecting savings associated with reducing the costs incurred in filling 2.5 million current patient prescriptions on an annual basis. Based on the increase in primary care volumes addressed in several other Harris Health System Waiver projects, further growth in volume to over 3.0 million prescriptions is projected. Despite this increase in prescription volume, processing costs are projected to decrease in total with the addition of the central fill function. The prompt availability of needed prescriptions for our underserved patients, particularly those with chronic disease that can be managed effectively with appropriate pharmaceuticals, will result in fewer emergency room visits for public and private hospitals located in the service area, and will also help to prevent future downstream inpatient admissions.

Project Option 2.9.1- Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care: Reduce ER Utilization for Top Frequenters

Unique RHP Project ID: 133355104.2.2 / Pass 1
Performing Provider Name/TPI: Harris Health System / 133355104

Project Summary:

Provider:
Harris Health System is comprised of 16 community health centers, seven school-based clinics, a dental center, dialysis center, five mobile health units, one outpatient specialty services clinic, and three hospitals. With a tax base of $511.6 million, Harris Health System was able to provide more than $1.254 billion in charity care during FY 2012.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 35,343 Births (babies delivered)- 6,643 Emergency visits- 173,263 Outpatient clinic visits- 1,054,770	Self-Pay- 62.6% Medicaid and CHIP- 23.4% Medicare- 8.6% Other Funding- 3.6% Commercial Insurance- 1.8%	Hispanic- 57.4% African American- 26.3% Caucasian- 9.2% Asian- 4.8% Other- 2.2% American Indian- 0.2%

Intervention(s):
This project will target top EC frequenters and ensure they are managed appropriately to receive the right care in the right setting through a navigation program.

Need for the project:
In 2010, more than 40% of Harris County ER visits by Harris County residents were primary care related, these include visits for conditions that are non-urgent, primary care treatable, and primary care preventable.

Target Population:
Any patient seeking care in the EC for primary care-treatable conditions may benefit from this project (Overall Payor Mix: Medicaid and CHIP-23.4% / Self-Pay- 62.6%).

Category 1 or 2 expected patient benefits:
Our goals are to increase the percent of patients without a PCP who receive an appointment from the EC and increase the percent of patients with a PCP who receive an appointment from the EC by 10% in DY4 and 20% in DY5. The program will target the top 100 most frequent ER utilizers by DY5.

Category 3 outcomes:
IT-9.4: Our goal is to reduce ER utilization rate for frequent user cohort by 10% in DY4 and 20% in DY5.

Project Option 2.9.1- Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care: Reduce ER Utilization for Top Frequenters

Unique RHP Project ID: 133355104.2.2 / Pass 1
Performing Provider Name/TPI: Harris Health System / 133355104

Project Description:
Harris Health System proposes a project that will target top EC frequenters and ensure they are managed appropriately to receive the right care in the right setting.

Harris Health aims to ensure patients receive appropriate care in the appropriate setting by identifying the cohort of highest EC frequenters at Ben Taub Hospital and Lyndon B. Johnson Hospital. This will allow targeted implementation of personalized management plan for more appropriate utilization of medical services and has been demonstrated to provide significant cost savings. A social worker and nurse will establish a baseline assessment of each patient identified in the cohort. The social worker will contact the patient by telephone. If the attempts are unsuccessful, the patient will be met at the next emergency center visit. During the initial contact the social worker, nurse and patient will create a plan to improve the patient's access to care and disease management. The social worker will contact the patient at mutually agreed upon intervals to monitor the patient's progress.

4.0 full-time equivalent (FTE) social workers will be required to initiate the program, which will expand to 8.0 FTE by DY5. 2.0 FTE nurses will be required to initiate the program. This will expand to 4.0 FTEs by DY5. These FTEs will be divided between Ben Taub Hospital and Lyndon B Johnson Hospital. Some physician oversight will be required. 0.5 physician FTEs, to be divided among Emergency Medicine at each hospital and Family Medicine, will be required to initiate the program. This will grow to 1.5 FTE by DY5.

Goals and Relationship to Regional Goals:
Project Goals:
The goal of this project is to identify the top ER Frequenter cohort and implement personalized management plans in order to decrease annual rate of ER usage for these patients. This project supports the region's goal to ensure patients receive the most appropriate care for their conditions.

This project addresses the following regional goals:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.

- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system

Challenges:
Top ER users suffer high rates of social dysfunction, substance abuse, and psychiatric dysfunction, creating disease management challenges. Barriers to managing a chronic disease include: access to a primary care physician, transportation to routine health care visits, homelessness, lack of personal Identification, health care literacy, and medication side effects.

5-Year Expected Outcomes:
Marked decrease in ER usage for the patient cohort is expected. Additionally, Harris Health expects to realize significant cost savings and improved clinical outcomes.

Baseline:
The navigation program does not yet exist; baseline data will be identified in DY2 and DY3 as appropriate.

Rationale:
ER usage by top frequenters represents a markedly disproportionate percent of ER and hospitalization costs. Careful navigation services that establish patient trust in the healthcare system can reduce utilization of emergency services and reduce costs significantly.[228] In 2010, over 40% of Harris County ER visits by Harris County residents were primary care related, these include visits for conditions that are non-urgent, primary care treatable, and primary care preventable. The average cost to treat these patients in the ER at Harris Health System versus a primary care setting was approximately $800 per visit for all age groups. The proposed navigation program will help patients access ongoing chronic care in appropriate settings, which can significantly decrease the cost of care for those patients.

Project Components:
Harris Health will meet the required project components:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency. A needs assessment will be conducted in DY1 to determine the appropriate structure of the program (P-1). Navigators will be trained in DY2. Training will include cultural competency components (P-2).

[228] Gawande A. The Hot Spotters: Can we lower medical costs by giving the neediest patients better care? *The New Yorker.* 2011. http://www.newyorker.com/reporting/2011/01/24/110124fa_fact_gawande. Accessed October 25, 2012.

b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators. Case managers will be trained and deployed in DY2 (P-2).
c) Connect patients to primary and preventive care. As one of the core components of the program, case managers will help patients obtain primary care appointments (I-6).
d) Increase access to care management and/or chronic care management, including education in chronic disease self-management. This will be completed as part of the development of the patient's individualized care plan.
e) Conduct quality improvement for the project, including identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. A follow-up needs assessment will be completed in DY4 to determine if the program is meeting the patients' needs. Improvements identified through the needs assessment will be implemented by DY5 (P-1).

Milestones and Metrics:
The following milestones and metrics have been selected based on the population needs:
- Process Milestones and Metrics: P-1 (P-1.1), P-2 (P-2.1)
- Improvement Milestones and Metrics: I-6 (I-6.4, I-6.5)

Unique Community Needs Identification Number:
This project addresses the following community needs as identified by the region:
- CN4 – Absence of care coordination for chronic conditions
- CN12 – Improved access to patient education and information
- CN13 – Improved services and access to care for the homeless population
- CN14 – Reduction in inappropriate emergency department utilization

How the project represents a new initiative for the Performing Provider:
Patient navigation services do not currently exist for frequent ER users. This initiative will improve access to coordinated care for patients who most need it.

Related Category 3 Outcome Measure:
OD-9 Right Care, Right Setting
IT-9.4 Other Outcome Improvement Target – ED Appropriate Utilization
Reasons/rationale for selecting the outcome measures:
In 2010, over 40% of Harris County ER visits by Harris County residents were primary care related, these include visits for conditions that are non-urgent, primary care treatable, and primary care preventable. The average cost to treat these patients in the ER versus a primary care setting was approximately $800 per visit for all age groups. Connecting patients who frequent the ER with consistent, coordinated primary and specialty care access will improve clinical outcomes, which will decrease the need to access emergent services.

Relationship to Other Projects:
A primary focus of the waiver as well as our region is ensuring appropriate emergency department utilization for our patient base. The lack of primary care, specialty care, and

behavioral health treatment currently creates congestion in the emergency departments thus increasing cost and comprehensive treatment of patients with chronic conditions. The ED initiatives focus to outcomes of readmission rates, appropriate ED utilization, and patient satisfaction and all initiative relationships can be found on the Region 3 initiative grid in the addendum.

Plan for Learning Collaborative:
We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:
This project will identify the highest utilizers of emergency room services in the Harris health System, and implement personalized navigation and management plans in order to decrease the annual rate of usage for these patients. The value of the project is based on cost savings associated with a substantial reduction in the utilization of emergency services, as well as helping to prevent future downstream inpatient admissions that frequently occur in this population. While the initial focus will begin with the top 100 patients, as the program expands we will drill further into the emergency room population and enroll more patients, as appropriate.

Project Option 2.8.6- Reduce Inappropriate ED Use: Emergency Center Advanced Triage Care

Unique RHP Project Identification Number: 133355104.2.3 / Pass 1
Performing Provider Name/TPI: Harris Health System / 133355104

Project Summary:

Provider:
Harris Health System is comprised of 16 community health centers, seven school-based clinics, a dental center, dialysis center, five mobile health units, one outpatient specialty services clinic, and three hospitals. With a tax base of $511.6 million, Harris Health System was able to provide more than $1.254 billion in charity care during FY 2012.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 35,343 Births (babies delivered)- 6,643 Emergency visits- 173,263 Outpatient clinic visits- 1,054,770	Self-Pay- 62.6% Medicaid and CHIP- 23.4% Medicare- 8.6% Other Funding- 3.6% Commercial Insurance- 1.8%	Hispanic- 57.4% African American- 26.3% Caucasian- 9.2% Asian- 4.8% Other- 2.2% American Indian- 0.2%

Intervention(s):
This project will improve emergency center throughput and reduce inappropriate use of emergency centers in the system through the implementation of a provider-in-triage model.

Need for the project:
In 2010, more than 40% of Harris County ER visits by Harris County residents were primary care related, these include visits for conditions that are non-urgent, primary care treatable, and primary care preventable.

Target Population:
All patients within the system seeking care in the ER for primary-care for treatable conditions may benefit from this project (Medicaid and CHIP-23.4% / Self-Pay- 62.6%). From January-September 2012, Harris Health saw 3,484 ESI 4 and ESI 5 patients combined.

Category 1 or 2 expected patient benefits:
Our goal is to decrease average length-of-stay in the ER by 1% compared to baseline in DY3, by 3% in DY4, and by 5% in DY5. We also aim to increase the number of patients seen through advanced triage model from 1,000 in DY3 to 5,000 by DY5.

Category 3 outcomes:
IT-9.4: Our goal is to reduce ER utilization rate for ESI level 5 patients by 5% of baseline in DY4 and 10% of baseline in DY5.

Project Option 2.8.6- Reduce Inappropriate ED Use: Emergency Center Advanced Triage Care

Unique RHP Project Identification Number: 133355104.2.3 / Pass 1
Performing Provider Name/TPI: Harris Health System / 133355104

Project Description:
Harris Health System proposes a project to improve emergency center throughput and reduce inappropriate use of emergency centers in the system.

In an effort to improve emergency center (EC) throughput, many emergency departments have placed physicians in the triage area. EMTALA mandates that all patients presenting to an Emergency Department be provided a medical screening exam to determine if an "emergency medical condition" exists that would require further evaluation and treatment. In the provider-in-triage model, a physician has the opportunity to provide this medical screening exam and determine if the patient should continue to receive care in the emergency department, or if the best care setting for the patient's condition would be at another care location (primary care office, urgent care center, etc.). Patients whose conditions can be treated appropriately in an outpatient clinic setting will be referred to a proximate same day outpatient clinic. In the event that a patient requires further care in the ED, the provider will initiate diagnostic testing (laboratory and imagining) while the patient returns to the waiting room. When the patient is evaluated later, testing should be completed, facilitating faster disposition.

The project will require 1.44 full-time equivalent (FTE) physicians initially, which will provide coverage for two shifts per week. By DY 5, 6.00 FTE will be dedicated to triage screening, or 5 shifts per week. The FTE will be split equally between Ben Taub Hospital and Lyndon B. Johnson Hospital.

Goals:
Project goals:

- Improving patient throughput times
- Improving efficiency by helping patients with non-urgent conditions receive appropriate care in the appropriate setting

This project addresses the following regional goals:

- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system

Challenges:

There are concerns regarding adding additional providers to a defined space in the triage area. EC redesign will be occurring during this timeline as well.

5-Year Expected Outcomes for Provider and Patients:
Improve throughput times of EC patients who meet emergency severity index (ESI) level 3-5 criteria. Increase the number of patients referred to proximate same day clinics.

Starting Point/Baseline:
Average length of stay and number of patients per month by ESI level, January-September 2012:

Ben Taub Hospital:

ESI 3 = 757 minutes (12.6 hours); 4,352 patients
ESI 4 = 473 minutes (7.9 hours); 1,466 patients
ESI 5 = 395 minutes (6.6 hours); 579 patients

Lyndon B. Johnson Hospital:

ESI 3 = 810 minutes (13.5 hours); 2,374 patients
ESI 4 = 568 minutes (9.5 hours); 1,274 patients
ESI 5 = 494 minutes (8.2 hours); 165 patients

Rationale:

In 2010, more than 40% of Harris County ER visits by Harris County residents were primary care related, these include visits for conditions that are non-urgent, primary care treatable, and primary care preventable. The average cost to treat these patients in the ER versus a primary care setting was approximately $800 per visit for all age groups. Referring patients with primary care treatable conditions to proximate same day clinics can help to reduce costs of care for the affected individual patients, freeing resources and improving efficiency for patients who need emergent care.

Placing a physician in triage will allow patients to receive medical screening before occupying an EC bed. Studies have shown that effectively positioning a physician in triage can decrease the time spent in an EC bed.[229] Several advanced triage models (e.g. nurse-led teams) have proven effective but are wrought with opportunities to mistake subtle complaints or symptoms for a non-emergency and allow acutely ill patients to wait prolonged times for treatment. Optimal patient safety supports a physician at triage ensuring expedient evaluation, appropriate diagnostic work-up and treatment[230]. Thus, by implementing a physician in triage model, we expect to improve efficiency while maintaining high quality standards of care.

Project Components:

[229] Russ S, Jones I, Aronsky D, Dittus RS, Slovis CM. Placing physician orders at triage: the effect on length of stay.
[230] Burström L, Nordberg M, Örnung G, CastréM, Wiklund T, Engtsröm ML, Enlund M. Physician-led team triage based on lean principles may be superior for efficiency and quality? A comparison of three emergency departments with different triage models. *Scandanavian Journal of Trauma, Resuscitation and Emergency Medicine.* 2012; 20:57-68.

There are no required project components for option 2.8.6.

Milestones & Metrics:

- Process Milestones and Metrics: P-4 (P-4.1), P-10 (P-10.1), P-12 (P-12.1)
- Improvement Milestones and Metrics: I-13 (I-13.1), I-14 (I-14.1)

Number of patients reached through advanced triage (progress toward goal) and length of stay (efficiency) are the selected improvement metrics. Metrics will be measured per hospital to account for variations in patient populations.

Unique Community Needs Identification Number:

- CN14 – Reduction in inappropriate emergency department utilization
-

How the project represents a new initiative for the Performing Provider:
Harris Health currently does not position physicians in the triage area. This initiative will improve ER efficiency and lengths of stay.

Related Category 3 Outcome Measures:
OD-9 Right Care, Right Setting
IT-9.4 Other Outcome Improvement Target – EC Appropriate Utilization for ESI Level 5 Patients

Reasons/rationale for selecting the outcome measures:

In 2010, over 40% of Harris County ER visits by Harris County residents were primary care related, these include visits for conditions that are non-urgent, primary care treatable, and primary care preventable. The average cost to treat these patients in the ER versus a primary care setting was approximately $627 per visit for all age groups.[231] Referring patients with primary care treatable conditions to proximate walk-in clinics can help to reduce costs of care for the affected individual patients, freeing resources and improving efficiency for patients who need emergent care.

Relationship to Other Projects:
A primary focus of the waiver as well as our region is ensuring appropriate emergency department utilization for our patient base. The lack of primary care, specialty care, and behavioral health treatment currently creates congestion in the emergency departments thus increasing cost and comprehensive treatment of patients with chronic conditions. The ED initiatives focus to outcomes of readmission rates, appropriate ED utilization, and patient satisfaction and all initiative relationships can be found on the Region 3 initiative grid in the addendum.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our

[231] School of Public Health, *Houston Hospitals Emergency Department Use Study: January 1, 2010 through December 31, 2010,* Houston, Texas: University of Texas Health Science Center at Houston, 2012.

participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

This project will improve patient throughput times for patients appropriately utilizing emergency room services, and improve the overall efficiency of the healthcare system by helping patients with non-urgent conditions receive appropriate care in a more cost effective setting. The value of the project is based on cost savings associated with a reduction in the utilization of emergency services by non-urgent patients. Referring patients with primary care treatable conditions to proximate walk-in clinics can also help to reduce costs of care for the affected individual patients, freeing resources and improving efficiency for patients who need emergent care.

Pass 3

Project Option 2.9.1- Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care: OB Navigation Program

Unique RHP Project Identification Number: 133355104.2.4 / Pass 3

Performing Provider Name/TPI: Harris Health System / 133355104

Project Summary:

Provider:

Harris Health System is comprised of 16 community health centers, seven school-based clinics, a dental center, dialysis center, five mobile health units, one outpatient specialty services clinic, and three hospitals. With a tax base of $511.6 million, Harris Health System was able to provide more than $1.254 billion in charity care during FY 2012.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 35,343 Births (babies delivered)- 6,643 Emergency visits- 173,263 Outpatient clinic visits- 1,054,770	Self-Pay- 62.6% Medicaid and CHIP- 23.4% Medicare- 8.6% Other Funding- 3.6% Commercial Insurance- 1.8%	Hispanic- 57.4% African American- 26.3% Caucasian- 9.2% Asian- 4.8% Other- 2.2% American Indian- 0.2%

Intervention(s):

This project will improve access to pre- and postnatal care through comprehensive, effective patient navigation through the Harris Health System and throughout a woman's pregnancy, with a focus on high-risk mothers.

Need for the project:

Harris County had 68,167 births in 2010. In FY2012, Harris Health delivered 6,643 babies. The Healthy People 2020 goal for low birth-weight births is 7.8%, while the percentage of low birth-weight births at the Harris Health System for 2011 was 9.9%.

Target Population:

Potential prenatal care patients across the county and within the system will be targeted. (2009 Harris Health Delivery Payor Mix: Medicaid- 62%/ Self-Pay and Indigent- 33%).

Category 1 or 2 expected patient benefits:

Our goal is to increase the number of unique patients served by 10% over baseline in DY4 and 15% in DY5. The team may serve more than 5,000 by DY5, depending on the patient population and team size.

Category 3 outcomes:

IT-8.2: In DY4, of those patients who received the intervention, decrease the percentage of babies born weighing <2,500 grams to less than DY3 percentage. DY5 is goal to be determined.

Project Option 2.9.1- Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care: OB Navigation Program

Unique RHP Project Identification Number: 133355104.2.4 / Pass 3

Performing Provider Name/TPI: Harris Health System / 133355104

Project Description:

We propose a project that would improve access to pre- and postnatal care through comprehensive, effective patient navigation through the Harris Health System and throughout a woman's pregnancy. Navigation efforts will be aimed at overall improved birth outcomes for Harris Health System obstetrics patients, such as increased gestational age and birth weight, and low infant and maternal mortality rates. However, specific improvement targets are described in the table and in Category 3 measure documents.

Funding for the OB Navigation Program will provide for a collaborative team of Navigators to include Community Health Workers (CHWs), Case Managers (CMs), Social Workers (SWs), and Nurses, who will be responsible for navigating high-risk mothers through the healthcare system throughout their pregnancy and to their postpartum appointment. The care team will be spread to cover all 13 facilities that provide obstetrics care in the Harris Health System. The care team will be responsible for recruiting women into prenatal care across the system and will route those patients through to postpartum care. They may also route existing obstetrics patients into postpartum care and subsequent primary care in a medical home. Through encounters in the medical home setting and with navigators, chronic conditions can also be addressed through patient education opportunities at health centers and access to chronic disease management programs. Internal efforts through P-1 in DY2 will produce a plan detailing the specific target population, size and skill mix of the care team needed, and additional strategies that will be used to manage and capture the target population.

Strategic areas within Harris Health System to enroll women will include facilities offering free pregnancy testing, the postpartum and NICU inpatient units, and the Emergency Departments. The University Of Texas School Of Public Health's 2009 ED analysis of primary care visits to the ED revealed that of the top 20 primary care related diagnosis in the 18-24 year old age Medicaid group, the top 3 diagnoses were for pregnancy related conditions. Moreover, a total of 7 of the 20 overall were pregnancy related diagnoses. P-5 in DYs 4 and 5 will report on the navigation services occurring in the EDs.

In the community, CHWs will engage women at external venues, such as apartment complexes, community centers, and local businesses. The team will ensure proper access to care, appointment scheduling, Medicaid/CHIP enrollment, and will use targeted outreach strategies and health education to reach patients early in pregnancy, especially when patients are at risk of leaving the care of Harris Health System. Once enrolled, patients will receive follow-up phone

calls, appointment reminders, case management services, education, and support from Navigators to ensure that patients continue prenatal care, delivery, and postpartum follow-ups. For the purposes of Improvement Milestone I-12 measurement, the definition of "enrolled" will be established in DY2. Navigators will hand patients off to the care of a primary care provider after the postpartum visit. Improvement milestones and goals in DY4 and DY5 concentrate on increasing the number of unique patients enrolled in the program. While accurate data collection issues will be addressed in DY2, reports from the Harris Health System EMR indicate that an average of approximately 600 OB Screening visits are completed each month across all Harris Health System health centers. An OB Screening visit indicates a recent positive pregnancy test. Using the current volume of OB Screening visits, a 10% increase in DY4 over the baseline number of patients enrolled in DY3 is a reasonable goal, irrespective of when enrollment begins in DY3. Furthermore, the goal of a 15% increase over baseline in DY5 is a reasonable expectation as lessons learned in DY4 will enhance outreach and enrollment efforts.

Targeted, "high-risk" mothers will exhibit risk factors relating to medical conditions, previous pre-term birth experience, and/or other socio-economic and psychosocial risk factors. Each of the Harris Health System health centers are located in areas of the community with populations at high-risk of delivering with poor outcomes. Navigators will use the EPIC EMR to collect data and document patient encounters.

We propose to target zip codes in Harris County with the poorest perinatal outcomes, including: highest rates of pre-term birth, low birth weight, and infant and maternal mortality. In addition, these areas exhibit low rates of entry into prenatal care during the first trimester. These areas coincide with areas of low-income poor socio-economic status. This data is currently available from the State and internal sources at Harris Health System and is reliable. By comparing the zip codes to Harris Health System care locations, it becomes clear that all health centers are strategically located to serve the high-risk, pregnant population.

Target Zip Codes:

77003	77021	77033	77048	77072	77082	77091	77520
77004	77022	77036	77051	77073	77083	77093	77521
77013	77026	77038	77053	77074	77086	77096	77530
77016	77028	77040	77054	77077	77088	77099	77562
77018	77031	77045	77067	77078	77090	77338	77587
77020	77032	77047	77071	77081	77506		

Goal(s) and Relationship to Regional Goal(s):

The goal of this project is to utilize community health workers, case managers, social workers, and nurses as a comprehensive patient navigation team that will provide enhanced care

coordination, community outreach, social support and culturally competent care to high-risk obstetrics patients throughout their pregnancy. Patient Navigators will ensure that patients receive coordinated, timely, and site-appropriate health care services. Navigators may assist in connecting patients to Ob care providers in Harris Health medical home sites, as well as diverting non-urgent obstetrics care from the Emergency Department to site-appropriate locations.

Project Goals:

- Increase the number of unique patients served by the Ob navigation program.
- Decrease percentage of low birth-weight births among patients who complete the program and deliver at Harris Health System.

This project meets the following Region 3 goals:

- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system, and
- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrasturcutre, is responsive to patient needs throughout the intire region, and improves health care outcomes and patient satisfaction.

The Ob Navigation program uses a patient-centered, coordinated care navigation model that aims to improve perinatal outcomes, improve satisfaction through timely access to appropriate care, and builds on the existing, successful network of Harris Health prenatal care access points. The program leverages the existing Harris Health prenatal care infrastructure to meet the need for increased enrollment in prenatal care with the goal of improving the poor perinatal outcomes currently exhibited in Harris County.

Challenges:

Currently, local data illustrates that perinatal outcomes in Harris County remain poor, despite boasting a world-renowned medical center. Harris County's preterm birth rates (13.3%), low birth weight rates (8.8 %), infant mortality (6.3/1000 live births), fetal mortality (6.2 1000 live births plus fetal deaths) and maternal mortality (21.4/100,000 live births)[1] are all higher than the Healthy People 2020 goal. Since 2005, there has also been a steady decline in first trimester prenatal care in Harris County (62% of births, compared to only 52.4% in 2010). Cultural and social determinants that are difficult to overcome contribute to Harris County's poor outcomes. The Ob navigation program will attempt to address this challenge through targeted, concerted outreach efforts to patients at high-risk of experiencing poor perinatal outcomes and entering prenatal care late.

5-Year Expected Outcome for Provider and Patients:

Harris Health System expects to see improvements in perinatal outcomes, specifically related to birth-weight births, for patients completing the program and delivering within the Harris Health System. Expected outcomes will relate to the project goals described above.

Starting Point/Baseline:

Currently, a patient navigation program does not exist for obstetrics patients at the Harris Health System. Therefore, the baseline will be set at 0 for DY1-2.

Rationale:

Reasons for selecting the project option:

Patient navigators will help patients and their families navigate the complex Harris Health System. The Ob navigation team will include: Community Health Workers (CHWs), Case Managers (CMs), Social Workers (SWs), and Nurses. Patient navigators will be chosen based on their ability to be compassionate, culturally competent, and knowledgeable about the health care setting.

An Ob navigation team is needed in the Harris County community. Harris County has had an average of 71,000 births per year since 2005 (5.6% of Texas births), with 68,167 births in 2010. Harris County's low birth weight rate (8.8 %) for the same year is higher than the Healthy People 2020 goal of 7.8% and higher than the 2010 national average of 8.15%. Moreover, the percentage of low birth-weight births at the Harris Health System (LBJ General Hospital and Ben Taub General Hospital combined) for 2011 was 9.9%. While this project is targeting low birth-weight percentages for the selected Category 3 outcome measure, it is important to note that Harris County performs poorly across many perinatal outcome measures.

In 2010, Harris County's preterm birth rate was 13.3% (9,096 pre-term babies). This rate has decreased slightly since 2005 (13.7%), yet remains above the national rate of 11.99% and the Healthy People 2020 goal of 11.4%. Within Harris County, there are great disparities regarding preterm birth rates; zip-code level data shows preterm birth rates ranging from 3.8% to 19.8%[1].

Since 2005, there has been a steady decline in first trimester prenatal care in Harris County (62% of births, compared to only 52.4% in 2010). Zip-code data identify disparities within the county, with rates for first trimester prenatal care ranging from 32.8% to 74.2%. Approximately 3.8% of the births in 2010 received no prenatal care. Births with no prenatal care range from 0 to 10% at the zip-code level.

The infant mortality rate in 2010 was 6.3/1,000 live births, which is above the Healthy People 2020 goal of 6.0/1,000 live births. Fetal mortality is high as well, at 6.2/1,000 live births plus fetal deaths, placing our rates above the Healthy People 2020 goal of 5.6/1,000 live births plus fetal deaths. Entering in to care early in pregnancy allows for accurate dating of pregnancy, identifying and treating health risk factors for the mother, and providing education. This is

especially important as about 39% of women in Harris County are uninsured prior to pregnancy and a high proportion of women responding to the Pregnancy Risk Assessment Monitoring System questionnaire women reported suboptimal preconception health[2]. Early identification of women with a previous preterm birth enables interventions to potentially prevent a subsequent preterm birth.

By comparing the attached maps, which include markers where Harris Health System health centers are located as well as our target zip codes (listed above), it becomes clear that all health centers are strategically located to serve the high-risk, pregnant population.

Project Components:

Through the Ob Navigation Program, we propose to meet all required project components listed below and believe that the selected milestones and metrics relate to project components.

a) *Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.* The navigation team will use the ED as contact point to engage pregnant women. Milestones 7 and 10 in DYs 4 and 5 will measure the navigation services provided to women the EDs at Ben Taub and LBJ General Hospitals. Cultural competency is not only part of required training for all Harris Health employees, but will also be a necessary skill for all members of the navigation team upon hiring.

b) *Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.* Milestones 2 and 3 in DY3 focus on the hiring and training of health professionals for this program, including: Case Manager, Social Workers, Community Health Workers, and Nurses.

c) Connect patients to primary and preventive care. While typically at the end of the navigation cycle, the connection from prenatal to postnatal and primary care is an integral part of the navigation team’s duties. Patients will be connected postnatal and primary care after delivery and during their pregnancy, as needed. As an established Harris Health patient, mothers will be quickly routed to their medical home.

d) Increase access to care management and/or chronic care management. As an established Harris Health patient, mothers will be quickly routed to their medical home. Many times, their prenatal care provider will be in the same facility as their primary care medical home. In the medical home, patients will find access to chronic disease management, care management, and education, as needed.

e) *Conduct quality improvement for project using methods such as rapid cycle improvement*. At a higher level, we will participate in face-to-face learning at least twice per year with other providers and the RHP to promote collaborative learning around similar navigation and obstetric-focused projects (DY3,4,5). At the ground level, we will monitor a consistent set of agreed-upon, evidence-based metrics to measure the effectiveness of the navigation program, both operationally and regarding outcomes. As opportunities for improvement are found, we will implement quality improvement processes and/or projects in partnership with our Quality Management Services department.

Patients will experience a hand-off to a primary care provider after the postpartum visit. If patients should need chronic care management or other treatment, a primary care visit will be scheduled. In addition, all preventive care needs will be met by the medical home.

Milestones & Metrics:

The following milestones and metrics have been chosen for the Ob Navigation Program project based on the core components and the needs of the target population:

- Process Milestones and Metrics: P-1 (P-1.1); P-2 (P-2.1); P-X (P-X.1); P-X2 (P-X2.1); P-8 (P-8.1);
- Improvement Milestones and Metrics: I-X (I-X.1) (I-X.2)

Customizable Improvement Milestones and Metrics were chosen in order to specifically tailor their intent to target the Ob population.

Unique community need identification number the project addresses:

The project addresses the following unique community needs as identified in the community needs assessment:

- CN.8- High rates of inappropriate emergency department utilization
- CN.14- High rates of poor birth outcomes and low birth-weight babies
- CN.15- Insufficient access to services for pregnant women, particularly low income women
- CN.23- Lack of patient navigation, patient and family education and information programs

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

Currently, a patient navigation program does not exist for obstetrics patients at the Harris Health System. The initiative will be new and will improve access for targeted patients while helping the system to reach capacity for treating obstetrics patients.

Related Category 3 Outcome Measure(s):

OD-8 Perinatal Outcomes:

IT-8.2 Percentage of Low Birth-weight Births

- The number of babies born weighing <2,500 grams at birth

Reasons/rationale for selecting the outcome measure(s):

Harris County's low birth weight rate (8.8 %) for the same year is higher than the Healthy People 2020 goal of 7.8% and higher than the 2010 national average of 8.15%. Moreover, the percentage of low birth-weight births at the Harris Health System (LBJ General Hospital and Ben Taub General Hospital combined) for 2011 was 9.9%. Low birth-weight rate is also a Healthy People 2020 objective. IT-8.2 will measure the percentage of low birth-weight births among those patients who have completed the OB Navigation program (received the intervention) by the time of delivery at a Harris Health System hospital. The definition of "program completion" will be determined during the DY2 planning period.

Relationship to other Projects and Other Performing Providers' Projects in the RHP:

The ability to properly identify and monitor specific patients with chronic conditions or frequent emergency department utilization trends will allow the region to accurately mange the very large patient base. Patient navigation includes a comprehensive list of tasks as well as unique provider types based on the focus of the initiative and will help the focus of cost containment, emergency department utilization, and chronic disease management. The Region 3 Initiative Grid in the addendum allows for a cross reference of all initiatives proposed within this concept.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The goal of this project is to utilize community health workers, case managers, social workers, and nurses as a comprehensive patient navigation team that will provide enhanced care coordination, community outreach, social support and culturally competent care to high-risk obstetrics patients throughout their pregnancy. The estimated number of high risk cases at Harris Health on an annual basis is over 2,000. All of those cases will be targeted by this program, with a goal to decrease the percentage of low birth-weight births among patients who complete the program and deliver at Harris Health System. Of those patients who receive patient navigation services, he goal is to decrease the percentage of babies born weighing <2,500 grams at birth to less than DY2 baseline.

Project Option 2.2.1 - Redesign the outpatient delivery system to coordinate care for patients with chronic diseases: Expansion of Point-Of-Care Services Provided by Clinical Pharmacists

Project Identification number: 133355104.2.5/ Pass 3

Performing Provider Name/TPI#: Harris Health/133355104

Project Summary:

Provider:

Harris Health System is comprised of 16 community health centers, seven school-based clinics, a dental center, dialysis center, five mobile health units, one outpatient specialty services clinic, and three hospitals. With a tax base of $511.6 million, Harris Health System was able to provide more than $1.254 billion in charity care during FY 2012.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 35,343 Births (babies delivered)- 6,643 Emergency visits- 173,263 Outpatient clinic visits- 1,054,770	Self-Pay- 62.6% Medicaid and CHIP- 23.4% Medicare- 8.6% Other Funding- 3.6% Commercial Insurance- 1.8%	Hispanic- 57.4% African American- 26.3% Caucasian- 9.2% Asian- 4.8% Other- 2.2% American Indian- 0.2%

Intervention(s):

This project will expand point-of-care services provided by clinical pharmacists for the chronic management of patients receiving anticoagulation therapy and create an educational website.

Need for the project:

Current resources make it difficult to provide timely and efficient post-hospitalization follow up for patients discharged on anticoagulation therapy. While the community standard is for post-hospitalization follow up to occur within 7 days, Harris Health is averaging 20 days for this population.

Target Population:

Patient discharged on anticoagulation therapy within the system may benefit from this project (Overall Payor Mix: Medicaid and CHIP-23.4% / Self-Pay- 62.6%).

Category 1 or 2 expected patient benefits:

Our goals are to increase the number of care management visits to 7500 by DY5, realize a 15 % increase the number of refills handled by the refill clinic by DY5, and realize a 75% increase in the number of patients receiving an appointment within 7 days of hospital discharge by DY5.

Category 3 outcomes:

IT-1.20: Our goal is to see a 40% increase from baseline of the number of patients seen by clinical pharmacists with at least 2 consecutive INRs at goal by the end of DY5.

IT-2.3: Our goal is to realize a 15% reduction from baseline in hospital admissions and emergency room visits secondary to warfarin complications by the end of DY5.

Project Option 2.2.1 - Redesign the outpatient delivery system to coordinate care for patients with chronic diseases: Expansion of Point-Of-Care Services Provided by Clinical Pharmacists

Project Identification number: 133355104.2.5/ Pass 3
Performing Provider Name/TPI#: Harris Health/133355104

Project Description: ***Harris Health proposes to expand point-of-care services provided by clinical pharmacists for the chronic management of patients receiving anticoagulation therapy.***

Our patient population continues to grow and require anticoagulation therapy monitoring, medication therapy management review to reduce polypharmacy, and provision of medication refills. Current resources have made it difficult to provide timely and efficient post-hospitalization follow up for patients discharged on anticoagulation therapy. While the community standard is for post-hospitalization follow up to occur within 7 days, Harris Health is averaging 20 days for this population. Infrequent or untimely follow up can lead to thrombotic or hemorrhagic complications requiring treatment in the emergency setting or hospitalization. This project will not only allow for additional outpatient capacity but will also create an educational/informational webpage for patients requiring anticoagulation monitoring. The webpage will provide information to educate patients on subjects such as self-management, drug interactions, foods high in vitamin K, emergency procedures and contact numbers.

Goals and Relationship to Regional Goals:

Project Goals:

- Avoid costly hemorrhagic and thrombotic complications
- Provide appropriate intensive monitoring and management of warfarin therapy
- Reduce adverse drug interactions and contraindications by controlling polypharmacy
- Support timely refills of medications through use of the refill clinics and protocols developed by the primary care providers
- Provide patients the tools they need to take an active role in their healthcare through the use of innovative technology.

This project meets the following regional goals:

- Our program will increase access to specialty care services by allowing us to monitor patients in a timely manner therefore improving patient outcomes and reducing possible complications.
- We will transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model through a coordinated effort involving nursing, pharmacy, physician and other ancillary services in attempts to prevent warfarin related complications. Studies have shown that this collaborative effort leads to improved patient outcomes and patient satisfaction.

- We will develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices via the use of electronic medical records, facilitate regional collaboration and sharing with other institutions providing anticoagulation management services, and engage patients, providers, and other stakeholders in the planning, implementation, and evaluation processes through constant communication with our medical home team members.

Challenges:

- Need for additional pharmacy clinicians and nursing support staff
- Space for daily clinic at multiple community health centers
- Cost of additional Point-Of-Care testing devices and associated supplies
- EHR reports that identifies patients suitable for pharmacy management and reports that identify pharmacist-managed patients utilization of emergency center and hospital resources would pose a challenge due to limited FTEs in the Information Technology department and the time to build and run reports

5-year Expected Outcome for Provider and Patients:

- Timely and appropriate follow-up in a pharmacist-run anticoagulation clinic
- Reduction in hospital admissions and emergency room visits secondary to thromboembolic events and bleeding complications
- Increased number of refill requests performed by pharmacists

Starting Point/Baseline:

- **Patient visits (FY13- 3/12 to 9/12):** 23,350
- **Unduplicated patients:** approximately 2300
- **Providers Trained**: 15 Harris Health employed clinical pharmacists; 1 community partner clinical pharmacist
- **Patient Encounters**: Pharmacist-managed clinics have completed 64,459 patient encounters over the 19 month period (March 1, 2011 to September 30, 2012).
- **Clinic Refills over a 3 month period**:
  - Average: 561 refills per month
  - Average MD completed: 238 refills per month
  - Average Pharmacist completed: 323 refills per month

Rationale:

Project option 2.2.1 (Redesign the outpatient delivery system to coordinate care for patients with chronic diseases) was chosen to justify the need for the expansion of point-of-care services provided by pharmacists; more specifically for the chronic management of patients receiving anticoagulation therapy. Pharmacist-managed anticoagulation clinics have been shown to improve outcomes in patients on long-term warfarin therapy.[1-7] Warfarin is the mainstay of oral anticoagulation therapy and its utilization has dramatically increased over recent years.[8,9] As the indications for oral anticoagulation therapy rise, regular monitoring of patients is pertinent to prevent increasing incidences of warfarin-related complications. This vision directly aligns itself

with a Joint Commission's National Safety Goal of a face-to-face encounter with a healthcare professional for anticoagulation monitoring.

Multiple studies evaluated the clinical implications of high medication burden and identified a heightened risk for medication misadventures such as therapeutic duplication and dosing errors which increase the risk for adverse drug events.[18, 19] Pharmacists are a cost-effective solution to the concern of medication-related adverse events. Studies indicate that pharmacist-driven Medication Therapy Management (MTM) programs effectively mitigate the potential for medication misadventures translating into the diminution of hospital admission/readmission rates and greater patient and institutional cost-savings.[20]

Chronic diseases are also a significant cause of morbidity and mortality; especially in patients with poor adherence.[21-23] Difficulty obtaining medication refills may worsen medication adherence.[24, 25] The increase in morbidity may in turn cause increased burden on the healthcare system. Studies have demonstrated that multidisciplinary team approaches to care, such as those involving pharmacist-physician collaboration, have shown positive impact in patient care and satisfaction.[26] Additionally, it has been demonstrated that pharmacist managed refill clinics can increase time efficiency and patient safety.[27-30]

In recent years there has been an increasing shift in warfarin therapy management from standard care by a physician to dedicated anticoagulation clinic models.[10] Pharmacist-managed anticoagulation clinics have been established to provide specialized care and manage patients more effectively.[3] These focused services aim to increase length of time International Normalized Ratios (INR)remain within a therapeutic range as well as reduce thromboembolic and bleeding complications.[4] Pharmacist-managed anticoagulation clinics provide patients with expert care, frequent monitoring, and education to ensure optimal outcomes and increased patient safety. Education and patient involvement have been shown to increase compliance, leading to improved INR control.[3] Studies have shown that in comparison to standard care by a physician, specialized pharmacist-managed clinics are associated with improved patient outcomes as a result of more frequent monitoring.[10, 11-15] In 2003, a clinical pharmacist completed 1971 visits, but as of fiscal year to date (2013) and 15 pharmacists later, 23,350 visits have been completed.

The Harris Health System program: Expansion of point-of-care services provided by clinical pharmacists is relevant to the RHP population because the project can easily be emulated by our Regional Healthcare Partners as needed.

Project components:

a. *Design and implement care teams that are tailored to the patient's health care needs, including non-physician health professionals, such as pharmacists doing medication management; case managers providing care outside of the clinic setting via phone, email, and home visits; nutritionists offering culturally and linguistically appropriate education; and health coaches helping patients to navigate the health care system* -We will design

and implement care teams that are tailored to the patient's healthcare needs through the collaborative efforts of clinical pharmacists, nursing staff, nutritionists, physicians, behavioral services, social services, and health educators to provide exceptional warfarin medication therapy management, reduce polypharmacy and increase number of refill requests performed by pharmacists.

b. *Ensure that patients can access their care teams in person or by phone or Email*-We will ensure that patients have complete access to their personal care teams primarily through face-to-face appointments during scheduled clinic hours as well as through phone and email access via "my health" which a web resource for patients to communicate with physicians, access test results, view clinics visits, and obtain a copy of their medical record.

c. *Increase patient engagement, such as through patient education, group visits, self-management support, improved patient-provider communication techniques, and coordination with community resources*-We will increase patient engagement through the use of personal patient education. Clinical pharmacists will educate patients on warfarin side effects, drug interactions, diet restrictions and medication use primarily through face-to-face encounters and telephone encounters after hours.

d. *Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions*- We will implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions through the innovative use of technology. A webpage designed for patients will include health tips that will assist in anticoagulation self-management and ultimately put the patient in control of their personal health. The collaborative efforts of all hospital services will help the patient make life-changing improvements in their health.

e. *Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net population* - We will conduct quality improvement for our program by assessing the impact of the point-of-care expansion, reporting the volume of patients seen, refills completed, the number of ED visits and hospitalizations, and adverse drug events, and evaluating any challenges that may be faced over the implementation period.

Milestones and Metrics:

- Process Milestones and Metrics: DY2: P-1, P-1.1; P-X, P-X.1; P-2, P-2.1; P-9, P-9.1
- Improvement Milestones and Metrics: I-X1, I-X1.1, I-X2, I-X2.1; I-21, I-21.1

Community need: The expansion of point-of-care services provided by clinical pharmacists addresses:

- CN.2- Inadequate access to specialty care

- CN.7- Insufficient access to care coordination practice management and integrated care treatment programs
- CN.11- High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease, including: Cancer, Diabetes, Obesity, Cardiovascular disease, Asthma, AIDS/HIV

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project significantly enhances our existing delivery system by increasing availability of persons qualified to manage acute and chronic care needs as related to anticoagulation management. This increase in availability not only allows for timely and more frequent patient follow up but also decreases the risk of potential complications which may require management in the acute care setting**.**

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Chronic Disease Management

IT-1.20 Other Outcome Improvement Target - Management of International Normalized Ratio (INR) for patients receiving anticoagulation monitoring (standalone measure)

The pharmacist-run point-of-care anticoagulation services provided by clinical pharmacists at Harris Health will ultimately result in improved patient outcomes. Pharmacist-managed anticoagulation clinics have been established to provide specialized care and manage patients more effectively.[3] These focused services aim to increase length of time INRs remain within a therapeutic range as well as reduce thromboembolic and bleeding complications.[4] Pharmacist-managed anticoagulation clinics provide patients with expert care, frequent monitoring, and education to ensure optimal outcomes and increased patient safety. Education and patient involvement have been shown to increase compliance; leading to improved INR control.[3] We will determine the total number of patients at Harris Health who have INR values for at least 2 consecutive visits by the end of DY2.

With the 6 additional anticoagulation clinics covering a volume of the large pool of patients on warfarin, we can expect that:

- 20% of all patients seen at Harris Health will have at least 2 consecutive INRs at goal by the end of DY3
- 30% of all patients seen at Harris Health will have at least 2 consecutive INRs at goal by the end of DY4
- 40% of all patients seen at Harris Health will have at least 2 consecutive INRs at goal by the end of DY5

OD-2 Potentially Preventable Admissions

IT-2.13 Other Admissions Rate – Hospital Admissions and Emergency Room Visits secondary to warfarin complications (Standalone measure)

There are numerous studies showing that anticoagulation clinics monitoring patients on warfarin have better outcomes as compared to traditional primary physician care. Mehta et al demonstrated that the implementation of an anticoagulation clinic decreased the rate of hemorrhagic and thromboembolic events and achieved better INR control when compared to traditional care by a physician.[7] A study by Cortelazzo et al, showed that an anticoagulation clinic attained superior anticoagulation control and reduced complication rates by 50% to 80% when compared with management provided by primary physicians and cardiologists.[16] Pharmacist-managed anticoagulation clinics have also been shown to decrease warfarin-related hospital admissions and length of stay.[3] This decrease in inpatient admissions, length of stay, and complications suggest that anticoagulation clinics may be a more cost-effective model than physician standard of care.[11,12,17] It is important that we establish a baseline for number of emergency room visits and hospital admissions from warfarin complications (i.e. major and minor bleeding events). We will compare this rate to the calculated rate post-initiation of the 6 pharmacist-run anticoagulation clinics. Based on prior studies and their outcomes, we can expect a:

- 5% reduction from baseline in the number of hospital admissions and emergency room visits secondary to warfarin complications rate at the end of DY3
- 10% reduction from baseline in the number of hospital admissions and emergency room visits secondary to warfarin complications rate at the end of DY4
- 15% reduction from baseline in the number of hospital admissions and emergency room visits secondary to warfarin complications rate at the end of DY5

Relationship to other Projects and Other Performing Providers' Projects in the RHP: Healthcare costs are significantly increased within a patient base with such aggressive chronic conditions that have gone untreated. The initiatives focused to chronic disease management focus to conditions such as asthma, hypertension, and diabetes and are similar in the approach of managing & proactively treating chronic conditions in order to reduce 30-day readmission rates, inappropriate emergency department utilization, and healthcare costs. The Region 3 Initiative grid allows a cross reference of initiatives associated with chronic disease management. (addendum)

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation: In recent years there has been an increasing shift in warfarin therapy management from standard care by a physician to dedicated anticoagulation clinic models. Pharmacist-managed anticoagulation clinics provide patients with expert care, frequent

monitoring, and education to ensure optimal outcomes and increased patient safety. Education and patient involvement have been shown to increase compliance, leading to improved patient outcomes as a result of more frequent monitoring. This project significantly enhances our existing delivery system by increasing availability of persons qualified to manage acute and chronic care needs as related to anticoagulation management. This increase in availability not only allows for timely and more frequent patient follow up but also decreases the risk of potential complications which may require management in the acute care setting, resulting in a measurable reduction in the number of hospital admissions and emergency room visits secondary to the warfarin complications rate.

Project Option 2.6.4 – Implement Evidence-based Health Promotion Program in an Innovative Manner: Integrated Promotion of Fruit and Vegetable Consumption in Primary Care through a Prescription for Healthy Eating Program.

Unique RHP Project Identification Number: 133355104.2.6/ Pass 3
Performing Provider Name/TPI: Harris Health System/133355104

Project Summary:

Provider:
Harris Health System is comprised of 16 community health centers, seven school-based clinics, a dental center, dialysis center, five mobile health units, one outpatient specialty services clinic, and three hospitals. With a tax base of $511.6 million, Harris Health System was able to provide more than $1.254 billion in charity care during FY 2012.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 35,343 Births (babies delivered)- 6,643 Emergency visits- 173,263 Outpatient clinic visits- 1,054,770	Self-Pay- 62.6% Medicaid and CHIP- 23.4% Medicare- 8.6% Other Funding- 3.6% Commercial Insurance- 1.8%	Hispanic- 57.4% African American- 26.3% Caucasian- 9.2% Asian- 4.8% Other- 2.2% American Indian- 0.2%

Intervention(s):
This project will develop a program for promoting increased consumption of fruits and vegetables among primary care patients through an integrated approach that includes multi-provider and multi-modal patient education and access to a clinic-based farmer's market.
Need for the project:
The need for health promotion activities related to fruit and vegetable consumption in Harris County is great. Less than 25% of individuals in the Houston area eat recommended servings of fruits and vegetables. Increase in consumption of fruits and vegetables are both targets for Healthy People 2020.
Target Population:
The target population for these goals includes any patient seen in primary care. (Medicaid and CHIP-23.4% / Self-Pay- 62.6%).
Category 1 or 2 expected patient benefits:
Our goal is to increase percentage of target population reached. The DY5 enrollment goal is 1000 patients/month.
Category 3 outcomes:
IT-6.1: Our goal is to increase patient satisfaction scores by 5% above baseline in DY3, 10% in DY4, and 15% in DY5.

Project Option 2.6.4 – Implement Evidence-based Health Promotion Program in an Innovative Manner: Integrated Promotion of Fruit and Vegetable Consumption in Primary Care through a Prescription for Healthy Eating Program.

Unique RHP Project Identification Number: 133355104.2.6/ Pass 3
Performing Provider Name/TPI: Harris Health System/133355104

Project Description:
Harris Health will develop a program for promoting increased consumption of fruits and vegetables among primary care patients through an integrated approach that includes multi-provider and multi-modal patient education and access to a clinic-based farmer's market.

The Integrated Promotion of Fruit and Vegetable Consumption in Primary Care project will bring together primary care providers, health educators, and nutrition specialists to promote increased fruit and vegetable consumption among primary care patients served by Harris Health System. The program will leverage a clinic-based farmer's market program as the platform from which educational activities will stem.

Harris Health System is the safety-net health system for Harris County, TX. It serves largely ethnic-minority populations (57% Hispanic and 26% African American) from low-income communities. Twenty-eight percent of patients are Medicaid or CHIP, 60% are self pay, and 98% live at or below 200% of the Federal Poverty Level. The health system has 13 community health centers in low-income communities throughout the county. Each is designated as a Medical Home and serves adults and pediatric populations. Approximately half of the clinics are located in United States Department of Agriculture designated food deserts.

Currently a small portion of patients within the system receive healthy eating education or nutrition counseling of any kind. None of the available services focuses specifically on the consumption of fruits and vegetables. This integrated promotion project will involve primary care providers discussing the importance and health benefits of fruit and vegetable consumption with their patients. This will be facilitated by the use of a "healthy eating prescription." The prescription will allow for the purchasing of discounted produce at a Medical Home-based produce market. In addition to the opportunity to purchase affordable produce, patients will receive education from a designated health educator and dietitian who will reinforce concepts related to the health benefits of the available produce. Likewise, a chef will be present on a regular basis to provide cooking demonstrations using foods from the market so that patients will have greater skill and understanding about how to prepare healthy foods for themselves and their families. Easy to understand recipes will be provided so that patients can practice their learned skills at home. The markets will be present in the Medical Home one half-day weekly so that even without "prescriptions" patients can return and benefit from access to fruits and vegetables, weekly education, and healthy food preparation activities.

Consistent with the Patient Centered Medical Home Model, the multi-component, multi-provider fruit and vegetable promotion team (individual primary care providers, dedicated health educator, nutritionist, and chef) will be located in the Medical Home locations. The team will initially rotate through each of 5 participating clinics. Expansion to 10 sites is expected in year 3 of the project period. Through the prescription program, it is expected that the health promotion team will be able to provide evidence-based, multi-component health promotion education about

fruit and vegetable consumption to an additional 1000 patients monthly. Quantification of participation will be assessed through redeemed prescriptions.

Goals and Relationship to Regional Goals:

The goal of this project is to use a multi-provider, multi-modal approach in the primary care setting to increase fruit and vegetable consumption promotion in high-risk patients. The primary care provider will be the initiator of the health promotion activity and will guide the patient to the other team members who will use the farmers markets as a means to encourage purchasing and consumption of fresh produce and who will provide demonstrations to increase patient taste preferences and self-efficacy around preparation of fresh produce.

Project Goals:

- Increase the number of primary care providers promoting the consumption of fruits and vegetables with patients
- Increase the number of patients receiving health promotion to increase fruit and vegetable consumption

This project meets the following regional goals:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system

The program leverages and builds on existing Harris Health Medical Home farmer's market infrastructure to meet the need for increased health promotion regarding fruit and vegetable consumption among of high-risk individuals served by the health system.

Challenges:

A primary challenge facing the program includes consistent provider promotion of fruit and vegetable consumption. Studies show that physician counseling on lifestyle behavior change has a positive impact on behavior adoption among patients.[1, 2] Providers in Harris Health System recognize the need to counsel patients on healthy lifestyle behavior, but are often hesitant because of the challenges patients face with compliance. This project will leverage the motivating power of the provider-patient relationship. It will equip providers with a tangible tool (prescription) to use in their counseling and will give patients a specific avenue for adoption of the recommended behavior.

An additional challenge involves patient-related barriers to buying fresh produce.[3] Evidence suggests that increasing access to produce in strategic ways can improve healthy eating practices.[4] In this project, the barrier of access is overcome by the presence of markets in the Medical Home. The barrier of cost is addressed by providing a discount on produce cost to patients who present/redeem their prescription at the market.

A third challenge is patient self-efficacy for fruit and vegetable preparation and consumption. Knowledge and skill on how to prepare fresh produce can be a barrier. There is evidence that cooking demonstrations and preparation plans can improve intake.[5, 6] This project will use cooking demonstrations and recipe cards to tackle those barriers.

5-Year Expected Outcome for Provider and Patients:

Harris Health System expects to provide evidence-based fruit and vegetable promotion services to high-risk primary care patients within the health system. Patients can expect to experience consistent, multi-provider integrated health promotion messaging around the health benefits of fruit and vegetable consumption.

Starting Point/Baseline:

Currently, Harris Health System has no evidence-based program to promote fruit and vegetable consumption.

Rationale:

It is recommended by the CDC and other health promoting organizations that individuals consume at least five servings of fruits and vegetables each day. For high risk populations, eight to ten servings are recommended.[7, 8] There is strong evidence from studies like Dietary Approaches to Stop Hypertension that diets high in fruits and vegetables can reduce blood pressure, stroke risk, and weight. It has also been shown to prevent some cancers, and diabetes.[7, 9-11]

The need for health promotion activities related to fruit and vegetable consumption in Harris County is great. Less than 25% of individuals in the Houston area eat recommended servings of fruits and vegetables. By eleventh grade, only 13% of youth eat adequate servings of fruit daily and only 5% eat adequate servings of vegetables.[12] For every serving above two servings of fruits or vegetables eaten daily, risk of ischemic heart disease related mortality decreases by 4%.[13] Increase in consumption of fruits and vegetables are both targets for Healthy People 2020. Specifically, an increase in total vegetable intake in persons two years of age and older is considered a Leading Health Indicator.[14]

Fruit and vegetable promotion interventions are most successful when there are multiple components to the educational initiative.[15] Hands on activities also enhance effectiveness and self-efficacy,[5] and behavioral prescriptions have been show to have positive impact on patient health promotion activities.[16] The project will enhance the medical home model by mitigating silo-based approaches to health promotion; it will integrate and coordinate messages from the primary care provider, health educator, and nutritionist. In addition, the project has the potential to transform the culture and the meaning of the Medical Home itself into one that truly communicates wellness and healthy living to its patients, staff, and the community in which it resides.

The process milestones and accompanying metrics for years 2-3 are consistent with P-3, P-7, and P-X of the RHP Planning Protocol. A multi-provider and multi-component health promotion team will be established to educate, model, and engage patients in the importance of fruits and vegetables for health. A baseline number of patients reached by the program will be established in DY2 and will be the basis for growth going forward. Ongoing plan-do-study-act cycles will allow for review of project data and response to data with new ideas and solutions for improvement.

Improvement outcomes in years 3, 4, and 5 will be based on I-8, increase percentage of target population reached. The establishment of the program will allow an increased number of patients to be reached by focused and coordinated promotion of fruit and vegetable consumption. The goal will be to educate 1000 patients monthly across 10 medical home sites on the health promoting benefits of fruit and vegetable intake.

Project Components:

The core project component will be met as the program is implemented, evaluated, strengthened and expanded into additional clinical sites.

a) *Conduct quality improvement for the project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, "lessons learned," opportunities to scale all or part of the project to a broader patient population, and key challenges associated with expansion of the project, including special considerations for safety-net populations.* Health promotion team members (health educator, dietitian) will meet weekly to review the number of "healthy eating prescriptions" written and redeemed. This will be facilitated by IT reports through the Electronic Health Record and hand-counts of prescriptions collected at the market. Based on utilization, team members will work with health center medical directors to increase provider prescribing patterns and increase patient use of the onsite markets and interactive health promotion activities.

Unique community need identification numbers the project addresses:

- CN.20 - Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

Currently there is no coordinated program for the promotion of fruit and vegetable consumption in Harris Health System. The education provided by primary care providers, health educators, and dietitians within the Medical Home is not coordinated or consistent. This initiative will provide a new, focused, and integrated health promotion program for patients served by the health system. It will also significantly enhance the effectiveness and reach of the health center-based farmer's market program that was piloted in 2011-12.

Related Category 3 Outcome Measures:

OD-6 Patient Satisfaction

IT-6.1: Percent improvement over baseline of patient satisfaction scores

The Category 3 Outcome Measure selected for this project reflects the practice's ability to support the adoption of healthy behaviors. Evidence suggests that patient satisfaction surveys are a useful tool for assessing and improving quality in practice.[17] Because the primary goal of this project is to increase the number of patients receiving health promotion counseling and self-management guidance around fruit and vegetable consumption, satisfaction regarding the integration of healthy eating promotion into care is an acceptable and established marker of reach and quality. Currently, Harris Health System's Press-Ganey administered patient satisfaction survey for out-patients includes a domain of questions about the care provider including an item specific to behaviors that improve health.

Relationship to Other Projects and Other Performing Providers in the RHP:

Healthcare treatment cannot focus to only the acute or chronic encounter and properly treat the patient. It is critical that our region focuses to patient education and community education to ensure a proactive and responsive approach to healthcare needs. The education

models represented in the Region 3 RHP plan can be identified in the Initiative Grid (addendum) and all focus to outcome measures such as appropriate utilization, patient satisfaction scores, and stand alone chronic condition scores such as diabetes and asthma.

Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The goal of the this project is to develop a program for promoting increased consumption of fruits and vegetables among primary care patients through an integrated approach that includes multi-provider and multi-modal patient education and access to a clinic-based farmer's market. Providers in Harris Health System recognize the need to counsel patients on healthy lifestyle behavior, but are often hesitant because of the challenges patients face with compliance. This project will leverage the motivating power of the provider-patient relationship. It will equip providers with a tangible tool (prescription) to use in their counseling and will give patients a specific avenue for adoption of the recommended behavior. The goal will be to educate 1,000 patients monthly across 10 medical home sites on the health promoting benefits of fruit and vegetable intake. Evidence from studies like Dietary Approaches to Stop Hypertension have determined that diets high in fruits and vegetables can reduce blood pressure, stroke risk, and weight. It has also been shown to prevent some cancers, and diabetes. Given the high level of chronic disease in the Harris Health patient population, improved diet can have immediate positive impact on the health of our patients, and result in long-term savings in emergency and acute care costs.

Project Option 2.10.2 - “Other”: Implement other evidence-based project to implement use of palliative care programs: Use of Palliative Care Programs

Unique RHP Project Identification Number: 133355104.2.7/ Pass 3
Provider Name/TPI: Harris Health System / 133355104

Project Summary:

Provider:
Harris Health System is comprised of 16 community health centers, seven school-based clinics, a dental center, dialysis center, five mobile health units, one outpatient specialty services clinic, and three hospitals. With a tax base of $511.6 million, Harris Health System was able to provide more than $1.254 billion in charity care during FY 2012.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 35,343 Births (babies delivered)- 6,643 Emergency visits- 173,263 Outpatient clinic visits- 1,054,770	Self-Pay- 62.6% Medicaid and CHIP- 23.4% Medicare- 8.6% Other Funding- 3.6% Commercial Insurance- 1.8%	Hispanic- 57.4% African American- 26.3% Caucasian- 9.2% Asian- 4.8% Other- 2.2% American Indian- 0.2%

Intervention(s):
This project will expand our comprehensive palliative care program through the creation of an integrated, interprofessional team of specially trained providers.

Need for the project:
The cost of care for seriously ill and dying patients is frequently greater than the reimbursement for such care due to long length-of-stay and utilization of high-cost beds (ICU), drugs, and procedures, and the fixed payment design of reimbursement.

Target Population:
The target population includes any patients with life-limiting or life-threatening diseases in the hospital clinic and at home. (Medicaid and CHIP-23.4% / Self-Pay- 62.6%).

Category 1 or 2 expected patient benefits:
Our goal is to improved access to Palliative Care Services for residents that did not have access. The goal for DY3 is 750 patients, 1250 in DY4, and 1500 in DY5.

Category 3 outcomes:
IT-13.1- Increase by 3% in DY4 and 5% in DY5 the percentage of who screened positive for pain and received a clinical assessment of pain within 24 hours of screening.
IT-13.3- Decrease the percentage of patients who died from cancer with more than one emergency room visit in the last days of life by 3% in DY4 and 5% in DY5.
IT-13.4- Decrease the percentage of patients who died from cancer or other life-limiting illness admitted to the ICU in the last 30 days of life by 3% in DY4 and 5% in DY5.

Project Option 2.10.2 - "Other": Implement other evidence-based project to implement use of palliative care programs: Use of Palliative Care Programs

Unique RHP Project Identification Number: / Pass 3
Provider Name/TPI: Harris Health System / 133355104

Project Description:

Harris Health System proposes to expand our comprehensive palliative care program. Costs at the end of life are greater than any time period during the lifespan due to multiple emergency center visits, unnecessary hospital admissions and long stays in the Intensive Care Unit. The central mission of palliative medicine is to improve or maintain quality of life in patients with life-limiting or life-threatening diseases. Palliative medicine is a recognized medical subspecialty of both the American Board of Medical Specialties and American Osteopathic Association. Palliative medicine involves the control of symptoms associated with chronic disease such as nausea, pain and shortness of breath, as well as management of the symptoms that are part of the dying process. Along with symptom control, palliative medicine teams provide comfort and social and spiritual interventions for patients & their families.

In our current program, we treat patients that have patients with life-limiting or life-threatening diseases in the hospital clinic and at home - in order to avoid unnecessary EC visits, ambulance rides, and hospital and ICU admissions. Numerous published articles have shown palliative care decreases hospital days, increases quality of care, and cuts cost. Since hospice care is not part of the schedule of benefits for the Harris Health System our palliative care team has been making house calls as a strategy to help these high-cost, debilitated, home-limited patients get access to care.

Harris Health System, in partnership with the University of Texas Health Science Center, plans to extend this palliative care program to serve more of the population in need within the region. This project will transform the course of care at the end of life and moves it from the EC and hospital setting to the home environment. This project will also increase access to services for the vulnerable palliative population and reduce costs of care. We propose to provide better, more cost-effective care to the most debilitated, expensive patients served by Harris Health within Harris County through the creation of an integrated, interprofessional team of specially trained providers. Care will be furnished by a physician /nurse practitioner-directed team of health care professionals who are available 24/7 (typically by telephone) to carry out individualized plans of care[9]. Our target population will be patients with life-limiting illness including cancer and heart failure who are at high risk for readmission after discharge home [8]. Therefore, a significant number of our new patient house calls will be "immediately" post-discharge visits[8].

In Demonstration Year 2 we will augment the existing Bridge Team by adding 2 NP FTEs and 1.5 MD FTEs. Each Bridge Team will care for 500 patients and make 2500 visits per year once fully active and subscribed. Other professionals, including dedicated pharmacists, therapists, and case managers, will participate in Interdisciplinary Team Meetings held face-to-face or virtually to discuss new and active patients. This interchange will facilitate communication and will contribute to the teaching component. Because the geographic area is so large, a key addition to the team will be a logistics expert who will design processes and schedule visits to minimize traveling distance and maximize efficiency.

Goals and Relationship to Regional Goals:
The goal of this project is to expand our Palliative Care Program with an increase in mid-level practitioners, physicians and social workers to provide palliative care to patients who would otherwise not have access.
Project goals:

- Improve access to palliative care providers which is very limited for this vulnerable population
- Maximize independence
- Reduce unnecessary emergency center visits
- Reduce unnecessary hospital and ICU visits
- Allow patients to receive pain and symptom control resulting in increased patient and caregiver satisfaction

This project meets the following regional goals:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.
- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system

Challenges:

The primary challenge will be recruitment of qualified professionals. Data from the 2007 American Hospital Association Annual Survey showed that between 2000 and 2005, the number of hospitals with palliative medicine programs grew by 96% from 632 to 1240[17]. U.S. News and World Report has included palliative medicine as a criterion in its rankings of America's Best Hospitals since 2003[18]. The development of programs is limited by the dearth of palliative medicine physicians – only 100 per year graduate from US programs [19]. Our affiliation with the training program for Palliative Physicians at the University of Texas Medical School Division of Geriatric and Palliative Medicine will help us address this challenge.

We have a long experience with Palliative Medicine and house calls programs (geriatric, elder abuse and palliative) and already know how to address liability issues, personal safety concerns, time constraints, reimbursement issues, lack of available technology, and logistic issues. We propose a single virtual technology driven coordinating site that will address many of these obstacles including some of the training issues and by linking cost avoidance to the effort in addition to reimbursement, the financial picture is enhanced greatly.

5-Year Expected Outcome for Providers and Patients:
Harris Health intends to improve the end of life care for thousands of residents in our region by increasing the access to pain and symptom control provided by palliative care. We will reduce the usually high costs of caring for these patients by providing the right type of care, in the right setting (hospital, clinic or home). This strategy will provide high satisfaction for patients and their families as well as the providers who serve them. It also allows the emergency center,

hospital and ICUs to be used for appropriate care as pain and symptom control are best delivered outside of these settings.

Starting Point/Baseline:

Our current comprehensive palliative house call program began in 2007. The program is currently staffed by 2.0 FTE nurse practitioners (NP) with palliative experience and 1.0 FTE palliative physician at LBJ Hospital. The panel size ranges from 50-60 patients and we make 300 house calls, 500 clinic visits and 350 new inpatient visits each year.

In order to create teams to serve more patients, we estimate that the ideal PC Team would be comprised of 2.5 physicians and 4 mid-level practitioners such as a nurse practitioner or physician assistants, which would be able to manage 250 palliative patients at any given time with a total of 500 patients being managed in a year. We expect the PC Team patients to survive for approximately six months out of a year. We estimate that we would see each patient for an average of 5 visits per year, completing about 2500 visits per year for each PC Team. The goal in Year 2 of the Waiver is to enhance the current PC Team within Harris Health. The goal in DY 3 and DY4 is to increase by 2 more PC Teams for a total of 4 PC Teams to cover each quadrant of the region served by the Harris Health System.

Rationale:

Palliative medicine programs markedly reduce lengths of stay in hospitals on both wards and ICU settings. According to Morrison et al JAGS supplement April 2007 n>25,000 subjects, palliative care teams saved $1,506 per acute care admission and $5,248 per ICU admission [20]. Palliative care is not hospice, but nonetheless does provide emotional support and relieving symptoms for people in the final six months of a terminal illness. In fact, palliative care can ease illnesses that aggressive treatments often trigger. Expansion of our current program can prevent futile hospital based care where each crisis can cost tens of thousands of dollars [22].

House call based care for home-bound individuals works [1]. Call Doctor Medical Group in San Diego reduced ER visits by 59%[1]. In New York, Mount Sinai Visiting Doctors program reduced hospitalizations by 66% [3]. And the patients are very happy with these programs. At a patient satisfaction rating of 82.7%, the VA House Calls program is the highest satisfaction rating ever received by a VA program[4, 5]. The Mount Sinai program reported 100% of the patients/caregivers believe the program improved their quality of life, 92% reported the quality of care as “outstanding” or “very good”, and 88% reported that the program “definitely” meets their needs[1]. We can have the best of both worlds, better care at lower costs.

Project Components:

This project option does not include any required core project components. However, we will increase our capacity to provide palliative care to more individuals, by: a) adding additional palliative care providers, b) adding social workers/case managers, c) adding a logistics expert, and d) forming multidisciplinary care teams. Additionally, we will use performance improvement principles to modify the selection criteria to increase the efficacy of the house calls intervention. We will compare the resource utilization for the three months prior to enrollment in the house calls program to the months after the house calls begin to start to assess the effects of this effort on resource utilization.

Milestones and Metrics:

Process:

P-5 Milestone: Implement/expand a palliative care program
P-5.1 Metric: Implement comprehensive palliative care program
P-6 Milestone: Increase the number of palliative care consults
P-6.1 Metric: Palliative care consults meet targets established by the program
P-X1 Establish patterns of resource usage including EC and hospital utilization and ICU stays.
P-X1.1 Metric: Evaluate intervention, modify intervention as appropriate, develop policies/ procedures, and share lessons learned.
Improvement:
I-11 Milestone: Establish the comfort of dying for patients with terminal illness within their End-of-life stage of care
I-11.2 Metric: Pain assessment (NQF-1637) Percentage of hospice or palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening.
I-14 Milestone: Improvements in palliative care services using innovative project option.
I-14.2 Metric: Target population reached through palliative care program: Improved access to PC Services for residents that did not have access.

Unique community need identification number the project addresses:
CN.2–Inadequate access to specialty care (palliative care); CN.6-Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly; CN.8-High rates of inappropriate emergency department utilization; CN.9-High rates of preventable hospital readmissions; and CN.10-High rates of preventable hospital admissions.

How the project represents a new initiative or significantly enhances an existing deliver system reform initiative:
Currently we provide this type of care to less than 350 persons a year with 2.0 providers (1 NP and 1 MD). We intend to increase the patient population served to 500/year per team for a total of 2000 patients served by the end of demonstration year (DY) 5.

<u>Related Category 3 Outcome Measures:</u>
OD- 13 Palliative Care
IT-13.1 Pain assessment (NQF-1637) *(Non-standalone measure)*
Increase the percentage of hospice or palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening. Exclusion: patients with length of stay < 1 day in palliative care who were not screened for pain. Patients who screen negative for pain are excluded from the denominator.
IT-13.3 Proportion with more than one emergency room visit in the last days of life (NQF 0211)- Percentage of patients who died from cancer with more than one emergency room visit in the last days of life.*(Standalone measure)*
IT-13.4 Proportion admitted to the ICU in the last 30 days of life (NQF 0213)-Percentage of patients who died from cancer admitted to the ICU in the last 30 days of life. *(Standalone measure)*

Reasons/rationale for selecting the outcome measures:
Provide palliative care services to improve patient outcomes and quality of life. Palliative medicine represents a different model of care, focusing not on cure at any cost but on relief and prevention of suffering. The priority is to support the best possible quality of life for the patient

and family, regardless of prognosis. Ideally, the principles of palliative care can be applied as far upstream as diagnosis, in tandem with cure-directed treatment, although it's still associated in most people's minds with end-of-life care. There is an economic incentive for hospitals to support palliative care—research shows significant reductions in pharmacy, laboratory, and intensive care costs.

Relationship to other Projects:
There is a proposed house calls program that is similar but targets a population of patients that are home-bound but not necessarily at the end of life, nor have life-limiting disease such as cancer or end stage heart failure. These two projects are complementary and not duplicative since the interventions on house calls will be vastly different.

Relationship to Other Performing Providers' Projects: The regional need for palliative care is that of upmost priority and is addressed in this initiative. This initiative is unique to Pass 1 initiatives and focuses to outcome measures of pain assessments, treatment preferences, and patients receiving hospice and palliative care. The Region 3 Initiative Grid (addendum) can provide a cross reference to all other initiatives.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation: The goal of this project is to expand our Palliative Care Program with an increase in mid-level practitioners, physicians and social workers to provide palliative care to patients who would otherwise not have access. This model has been shown to prevent emergency center visits, as well as hospital and ICU admissions. The cost of care for seriously ill and dying patients is frequently greater than the reimbursement for such care due to long length-of-stay and utilization of high-cost beds (ICU), drugs, and procedures, and the fixed payment design of reimbursement. Currently we provide this type of care to less than 350 persons a year. We intend to increase the patient population served to a total of 2000 patients by the end of demonstration year (DY) 5. The research available regarding palliative care shows significant reductions in pharmacy, laboratory, and intensive care costs for care coordinated through a palliative program.

Matagorda Regional Medical Center

Pass 2

Project Option 2.9.1: Provide navigation services to targeted patients who are at risk of disconnect from institutionalized health care: Establish a Patient Care Navigation Program

Unique RHP Project Identification Number: 130959304.2.1 / Pass 2
Performing Provider Name/TPI: Matagorda Regional Medical Center/ 130959304

Project Summary:

Provider:
Matagorda Regional Medical Center is a wholly owned part of Matagorda County Hospital District. The District also operates a primary care clinic for patients qualified for the District's Medical Assistance Program. The Hospital is a 58 bed acute care facility with a Level III trauma designation.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital admissions- 2594 Births - 381 Emergency visits- 18600 Surgeries – 1598 Outpatient visits -18260	Self-Pay- 11.5% Medicaid and CHIP- 12.8% Medicare- 50.1% Commercial Insurance- 22.5% Charity- 3.1%	Hispanic- 31.1% African American- 17.2% Caucasian- 50.1% Other- 1.6%

Intervention(s):
The Patient Care Navigation Service will utilize community health workers, case managers, and /or other types of health care professionals to provide enhanced social support and culturally competent care to vulnerable and/or high risk patients; to assist patients in connecting to available primary, specialty, and chronic disease care sites; and to decrease inappropriate visits to the hospital emergency department by steering non-urgent care to available alternatives.

Need for the project**:**
While there has been positive progress in expanding access to community based care, current data reflects that between 40 and 50% of Matagorda Regional Medical Center Emergency Department visits are for diagnosis that could safely be treated in a clinic setting.

Target Population**:**
All patients within the system with may benefit from this project (Medicaid and CHIP-23.4% / Self-Pay- 62.6%), specifically those with no primary care home.

Category 1 or 2 expected patient benefits**:**
Matagorda Regional Medical Center expects to see a decrease in the number of unnecessary visits to the Emergency Department by patients enrolled in the Navigation Program. Our goal is to have 500 frequent ED patients actively enrolled in the Navigation Program by the end of year 5.

Category 3 outcomes:
IT-9.2: Our goal is a 25% reduction in unnecessary Emergency Department visits within one year of each patient's enrollment date in the Patient Care Navigation Service.

Project Option 2.9.1: Provide navigation services to targeted patients who are at risk of disconnect from institutionalized health care: Establish a Patient Care Navigation Program

Unique RHP Project Identification Number: 130959304.2.1 / Pass 2
Performing Provider Name/TPI: Matagorda Regional Medical Center/ 130959304

Project Description:
A joint planning team was formed with representatives of Matagorda County Hospital District/Matagorda Regional Medical Center, Matagorda Episcopal Health Outreach Program (MEHOP – FQHC), and Palacios Community Medical Center to explore potential models for collaboration. The transformation goals described in the Waiver helped the group crystallize their plans and a new partnership was formed to move the joint planning effort forward. This new organization, Coastal Health Connection, is being incorporated to further the concept of shared infrastructure and shared planning to improve the health of the community. The DSRIP project to establish a Patient Care Navigation Program is an outgrowth of this shared vision of a healthier community.

While there has been positive progress in expanding access to community based care, current data reflects that between 40 and 50% of Matagorda Regional Medical Center Emergency Department visits are for diagnosis that could safely be treated in a clinic setting. During the past 3 years, the community has seen the addition of a well-organized and staffed FQHC (MEHOP), expanded use of physician extenders, and the opening of a private urgent care center and there are active plans in place to continue to improve access to both primary and specialty care throughout the region. The continued inappropriate use of the hospital emergency department as a source of non-emergent care underscores the need for a program or service that will ensure patients receive coordinated, timely, and site-appropriate health care services.

The target zip codes include all of those in Matagorda County and it is expected this program will receive patients from surrounding counties since the patient panels at MEHOP include patients from Matagorda, Wharton, Jackson, and Brazoria counties.

Target Zip Codes:
77414,77404,77456,77465,77457,77419,77458,77415,77428,77440,77480,77483

Project Goal(s) and Relationship to Regional Goal(s):

Project Goals:

- Utilize community health workers, case managers, and /or other types of health care professionals as patient navigators;
- Provide enhanced social support and culturally competent care to vulnerable and/or high risk patients;
- Assist patients in connecting to available primary, specialty, and chronic disease care sites;

- Decrease inappropriate visits to the hospital emergency department by steering non-urgent care to available alternatives.

This project meets the following Region 3 goals:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system.

Challenges or Issues Faced:

As a designated health manpower shortage area, access to care is a challenge – particularly access to primary care. The access issue is compounded by the high poverty rate of the County.

The population profile of Matagorda County shows that approximately 50% of the residents live outside the county seat in remote low density areas. Communication about available resources is a challenge.

As a result of these factors, the emergency departments of both hospitals in the county have become the first choice for routine care for many residents of the county. These patterns are long established and often multi-generational. EMTALA, lack of resources, and cultural habits make the emergency department a difficult place from which to steer patients to more appropriate venues for care.

How the Project Addresses Challenges/Issues:

The Patient Care Navigation Program will be a critical component of expanding access to care in the community. There are a number of exciting plans in Matagorda County to expand access and recruit additional providers. Without a mechanism to communicate about the available resources, particularly in more remote areas, patients will not know to seek other venues and continue to rely on the emergency departments. Because the Navigation Program will be custom to the needs of the target populations, the most effective and culturally sensitive method of communication and education can be used.

5-Year Expected Outcome for Provider and Patients:

Matagorda Regional Medical Center expects to see a decrease in the number of unnecessary visits to the Emergency Department by patients enrolled in the Navigation Program. By effectively using community based navigators to "connect" to the target population they are assigned, it is anticipated that through personal communication, education, and advice, patients will more often receive the right care in the right setting. By creating a system of care focused on a coordinated, collaborative approach and early intervention, patients will not be as likely to get "lost" and end up in health crises. The expected outcome is to reduce unnecessary visits to the Emergency Department for the population of patients managed through the Patient Care Navigation Program. Our goal is to have 500 frequent ED patients actively enrolled in the

Navigation Program by the end of year 5 with a 25% reduction in unnecessary Emergency Department visits within one year of each patient's enrollment date.

Starting Point/Baseline:
A Patient Care Navigation Program does not exist for the Matagorda County region and therefore we have no patients in a system of care navigation.

Rationale/Reasons for selecting the project option:
The county is served by two acute care hospitals, Matagorda Regional Medical Center and Palacios Community Medical Center. In 2010, the facilities reported 19,368 emergency visits. The hospitals provided more than $16 million in uncompensated care, which accounted for 14.9% of total patient revenue, the second highest percentage in the region.[232] Between 40 and 50% of the visits to the MRMC Emergency Department in 2012[233] could be considered non-emergent and potentially could be cared for in a less costly venue.

Matagorda County includes the towns of Bay City and Palacios, as well as 15 smaller communities spread throughout the county of more than 1,000 square miles. More than 36,000 people live within the county which has a median household income of $39,874. Nearly 20% of the population lives below the poverty level, and the county has the second highest rate of children living in poverty at 28.4%.[234]

These factors supported recognition that a personal, almost one-on-one approach was needed to begin re-educating a population that for generations have relied on the emergency department as a primary source of health care. The Patient Care Navigation Program represents that approach.

Project Components:
The required core project components include the following:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.
b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.
c) Connect patients to primary and preventive care.
d) Increase access to care management and/or chronic care management, including education in chronic disease self-management.
e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

---

[232] 2010 Cooperative DSHS/AHA/THA Annual Survey of Hospitals and Hospitals Tracking Database
[233] 2012 MCHD Statistical Data Sheet
[234] U.S. Census Bureau, 2010 Census

We will meet these project components with the establishment of the Patient Care Navigation Program as follows:

15. Identification of the target patient base defined by frequent emergency department visits
    - Estimated cost for analysis: $50,000 - $75,000
16. Development of patient care navigator team including support and administrative staff
    - Staffing plan development including job descriptions: $25,000 - $30,000
    - Recruitment: $20,000
    - Training: $150,000 initial; $25,000/year ongoing
    - Staffing: $600,000
17. Program Offices
    - Space Lease (4 – 5 locations): $120,000/year
    - Furniture/equipment: $50,000
    - Vehicles: $60,000
18. Develop a collaborative model with the primary care community to utilize navigation program
    - Informational material, education, etc: $10,000/year
19. Establish of baseline metrics and then continual measurement for improvement while utilizing process techniques such as PDSA cycles for improvement
    - IT (patient tracking, scheduling, referral systems): $20,000 (one time) + $10,000/year
20. Communication of program information and success in the county, area and region.
    - Educational material, etc.: $10,000

Milestones & Metrics:
The following milestones and metrics have been chosen for the Chronic Care Clinic project based on the core components and the needs of the target population:
Process Milestones and Metrics:P-1 (P-1.1); P-2 (P-2.1; 2.2);P-3(P-3.1); P-5 (P-5.1); P-8 (P-8.1); Improvement Milestones and Metrics: I-6(I-6..2); I-8(I-8.1)

Unique community need identification number the project addresses:
The project addresses the following unique community needs as identified in the community needs assessment:

CN.1 Access to primary and specialty care
CN.2 High utilization of hospital emergency room for non-emergent care
CN.3 Percent Uninsured (29.2%) and Percent Poverty (22%) in Matagorda County
CN.4 HPSA score of 16

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:
As a Hospital District, the main focus of the organization has been on the acute end of the care continuum – primarily hospital and emergency department services. This initiative partners the District with the community through a collaborative with other providers to help patients get the right care in the right setting. This project will also enhance another project goal of creating a

system of care for chronic diseases by placing trained patient care navigators in the community to identify opportunities to steer patients into that system.

Related Category 3 Outcome Measure(s):
OD-9Right Care, Right Setting:
IT-9.2 ED appropriate utilization

- Reduce all ED visits (including ACSC)[235]
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)[236]
- Reduce Emergency Department visits for target conditions
    - Congestive Heart Failure
    - Diabetes
    - End Stage Renal Disease
    - Cardiovascular Disease /Hypertension
    - Behavioral Health/Substance Abuse
    - Chronic Obstructive Pulmonary Disease
    - Asthma

Reasons/rationale for selecting the outcome measure(s):
Because such a high percentage of the population is uninsured, low income, and under-educated, connecting to the right setting for care can be challenging. The barriers created by these factors include economic and communication. Generations of families have come to rely on the emergency department of hospitals as their sole source of health care.

While there are many factors involved in calculating actual cost savings available if a patient receives care in the most cost effective setting, the charge associated with the lowest acuity visit for a local hospital ED visit is over double that of the same coded visit in a local community clinic.[237] With over 9000 emergency department visits per year in Matagorda County potentially being eligible for care in a different venue, the impact could be significant.

Relationship to Other Projects:
MCHD is also developing a Chronic Disease Specialty Clinic. While the Patient Care Navigation System is not specifically aimed at the chronic disease population, the two projects will overlap with an integrated referral system and have positive impact on appropriate use of the ED.

Relationship to Other Performing Providers' Projects in the RHP:
The ability to properly identify and monitor specific patients with chronic conditions or frequent emergency department utilization trends will allow the region to accurately mange the very large patient base. Patient navigation includes a comprehensive list of tasks as well as unique provider types based on the focus of the initiative and will help the focus of cost containment, emergency department utilization, and chronic disease management. The Region 3 Initiative Grid in the addendum allows for a cross reference of all initiatives proposed within this concept.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:
Matagorda Regional Medical Center has approximately 20,000 visits to the Emergency Department annually. Records reflect a potential of 40 – 50%[238] of the visits could have been treated in another venue. If the Patient Care Navigator Program is successful at reducing unnecessary ED visits by a conservative 10%, a savings of as much as $2,000,000[239] could be realized by the end of the project period (as compared to a standard physician office visit).

Memorial Hermann Hospital

Pass 1

Project Option: 2.9.2 Expand COPE/ER Navigation Program
Performing Provider: Memorial Hermann Hospital/TPI 137805107
Unique Project ID: 137805107.2.1

- Provider: Memorial Hermann Hospital (Memorial) is an 860 bed hospital located in Houston, TX and is part of the Houston-Sugarland-Baytown MSA. The MSA population served by Memorial is approximately 6,000,000 people.

- Intervention(s): Memorial will expand the current Community Outreach for Personal Empowerment (COPE) and ER Navigation programs to further identify uninsured and Medicaid patients utilizing emergency rooms for lower acuity conditions. The expansion will be located in Memorial's three busiest emergency rooms during the busiest shifts and include hiring additional Navigators to meet demand.

- Need for the project: Emergency Department (ED) use for conditions preventable or treatable with appropriate primary care is associated with inefficient processes and increased risk for poor outcomes. The expansion of COPE and the Navigation will improve access to health care, reduce inappropriate utilization of healthcare facilities and educate individuals about the health and social service resources available to them.

- Target population: The target population is all uninsured patients that access the ER for primary care purposes. Future plans are to add Medicaid patients. The expansion of the existing COPE and ER Navigation programs will benefit an estimated 15,000 to 30,000 additional patients annually.

- Category 1 or 2 expected patient benefits: The expansion of the COPE and ER Navigation programs will establish a baseline of patients reached by Navigators and by DY5 will increase patient contact by 15% over the baseline measured in DY2.

- Category 3 outcomes: IT 9.4 – Memorial will collect ED utilization data for patients enrolled in the programs and by DY5, Memorial intends to reduce ED visits in 6 months after enrollment in the programs by 10% under the DY3 baseline.

Project Option 2.9.2- Other Option: Expand COPE /ER Navigation Program

Unique RHP Project Identification Number: 137805107.2.1
Performing Provider Name/TPI: Memorial Hermann Hospital (Memorial)/137805107

Project Description: This project will identify uninsured and Medicaid patients utilizing emergency rooms for lower acuity conditions and uninsured patients with a history of repeat ER visits and hospitalizations and, through education, guidance, and follow-up by Certified Community Health Workers (Navigators) and social workers improve access to health care, reduce inappropriate utilization of health care facilities, and educate individuals about the health and social service resources available to them. Through this education and referral to accessible resources, the use of the ER as a primary source of healthcare and/or the escalation of medical conditions resulting from the lack of primary care follow-up that end up in the ER and hospital should be reduced. This project is an expansion of Memorial Hermann's current Community Outreach For Personal Empowerment (COPE) and ER Navigation programs.

Emergency Department (ED) use for conditions preventable or treatable with appropriate primary care is associated with inefficient processes and increased risk for poor outcomes. The Memorial Hermann COPE and ER Navigation programs will engage social workers and certified Community Health Workers who have the training, cultural understanding, and linguistic capacity to help the uninsured and at-risk populations, who disproportionately use emergency rooms and other hospital services for healthcare, 'navigate' the complex health system, obtain a medical home, schedule appointments, and cope with future healthcare concerns.

The navigation program will be located in Memorial Hermann's three busiest emergency rooms, during the busiest shifts, and serve all uninsured patients that access the ER for primary care purposes. Near future plans are to add Medicaid patients who are uncertain of or uninformed regarding their primary care provider. The COPE program will place mobile staff across all nine Memorial Hermann acute care hospitals and cover high utilizers of inpatient and observation care as well as ER care via collaboration with ER Navigators, phone and travel.

This project proposes to increase the current four Certified Community Health Workers (Navigators) to 14 navigators and one manager to cover all nine of Memorial Hermann's ERs and to increase the current four person COPE staff (three social workers and one navigator) by 6 social workers and 2 navigators to increase program penetration, flexibility, and productivity. One Director to manage both programs is also included. This expansion will result in navigation and follow-up of 28,470 additional patients annually.

Both programs require active interventions, tools, and empowering communication to help patients identify, access and obtain community-based services. By using patient navigators to effectively connect uninsured and Medicaid patients with medical homes and other resources and support services, overall primary care ER utilization and costs among target populations will decrease.

Goal(s) and relationship to Regional goal(s):

Project goals:

The goal of this project is to improve access to health care, reduce inappropriate utilization of health care facilities, and to educate individuals about the health and social service resources available to them. Through education and referral to accessible resources, the use of the ER as a primary source of healthcare and/or the escalation of medical conditions resulting from the lack of primary care follow-up that end up in the ER should be reduced. To ensure success, staff will be carefully selected and appropriately trained based on his or her familiarity with the local community's culture, language, values and vast knowledge about local health care services and community programs. Staff will work one-on-one with individuals and families to identify their needs and link them to community resources that will improve their health, quality of their lives and overall well-being. Much of the work will be done in follow-up, after discharge, ensuring that a clinic appointment was made and was successful; assisting with paperwork required to qualify for Medicaid, CHIP, or county indigent programs; helping individuals and families access resources available in the community such as food, clothing, shelter, employment support, and counseling; and, referring individuals and families to area Benefit Bank of Texas (TBB-TX) counselors to sign up for local, state and federal health care resources and social services such as SNAP/Food Stamps, FAFSA, Medicaid, CHIP, Medicare Extra Help – Prescription and federal taxes. (TBB-TX has recently expanded into Houston.)

This project meets the following Region 3 goals:

- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model improving patient satisfaction and health outcomes, reducing unnecessary or duplicative services, and building on accomplishments of our existing health care system.

Challenges and how addressed:

Integral to success is the work done post discharge, ensuring that a clinic appointment was made and kept and assisting with paperwork required to qualify for Medicaid, CHIP, or county indigent programs. The population "navigated" is often transient, and communicating with them beyond the short-term is often difficult with phone numbers and residences changing frequently. Memorial will structure this project in order to overcome these challenges, through careful planning, and conducting ongoing quality improvement activities upon its implementation.

5-year expected outcome for provider and patients:

This request proposes to increase the current four Certified Community Health Workers (navigators) to 14 navigators and one manager to cover all nine of Memorial Hermann's ERs and to increase the current four person COPE staff (three social workers and one navigator) by six social workers and two navigators to increase program penetration, flexibility, and productivity. One Director to manage both programs is also included. This expansion will result in navigation and follow-up of 28,470 additional patients annually.

Starting Point/Baseline: Memorial currently has a COPE and ER Navigation program but is looking to expand them within all Memorial facilities in Region 3. ER Navigation is currently at Memorial Hermann Hospitals Southwest, Northwest, and TMC and will be expanded to Southeast, The Woodlands, Memorial City, Katy, Sugar Land, and Northeast. COPE currently covers all Memorial acute facilities but with only a 4 person staff. Expansion of COPE staff will increase program penetration, flexibility, and productivity within all 9 facilities.

Rationale:

Traditionally, a hospital's care of patients ends the instant the patient is discharged. This has resulted in fragmented or overlapping care that is complicated for patients to access and navigate. This complexity often results in no follow-up care, and an inappropriate return to the hospital. This project will offer targeted patient populations assistance in coordinating their care. In addition to helping individual patients, this project will allow all providers across the spectrum of care to utilize their resources more efficiently, delivering care to patients in the most appropriate setting. This will result in lower costs for the delivery system and higher patient satisfaction.

This project uses staff in an effective, cost efficient model to help uninsured and at-risk patients who are high utilizers of health services and/or use the ERs for primary care purposes to: become empowered participants, capable of taking control of their healthcare through the use of appropriate, available, local community resources; to decrease hospital ER visits, observation stays, and inpatients admissions; and to document decreased reliance on the ER as a source for primary and chronic health care. The pilot study of Memorial Hermann's existing ER Navigation Program found that in our target population of uninsured and publicly insured patients, mean ER visits significantly declined in the 12-month post-intervention period, compared to the 12-month pre-intervention period. After conducting several sub-analyses based on frequency of pre-intervention PCR ED use, we found this result to be robust for both low and high utilizers of ED services. The pilot study of Memorial Hermann's existing COPE Program found that in our target population of uninsured patients reductions in ER/Observation/Inpatient utilization resulted in a savings of $5,328 per patient. The savings associated with both programs far outweighs the costs to implement them. Additionally, Both programs' findings are consistent with previous research demonstrating that case management effectively reduced the total number of visits for high ED utilizers (Okin et al., 2000; Pope, Fernandes, Bouthillette, & Etherington, 2000).

Project Components:

This project option does not have any required core components.

Unique community need identification number the project addresses:

- CN.8: High rates of inappropriate emergency department utilization
- CN.9: High rates of preventable hospital readmissions
- CN.10: High rates of preventable hospital admissions

How the project represents a new initiative for Performing Provider or significantly enhances an existing delivery system reform initiative:

Memorial currently completes limited post-discharge support for a small subset of its patient population. This program would allow Memorial to expand the level of post-discharge support by dedicating personnel and resources, offering enhanced support such as transportation, and offering navigation services to all patients with certain targeted conditions.

Related Category 3 Outcome Measure(s): OD-9: Right Care, Right Setting; IT 9.4 Other Outcome Improvement Target—ED Appropriate Utilization.

Data Collection Methodology: Memorial Hermann resources are compared pre/post-navigation intervention at like pre/post intervals; i.e. pre/post 6 months, pre/post 1 year, etc.

- Pre data: # of ER visits 6 months pre-navigation intervention.
- Post data: # of ER visits 6 months post-navigation intervention.
  - This data is similarly compared at 12 months, 18 months, and 24 months.
  - This data is similarly compared for a sub-population identified as frequent flyers: those with 1+ pre-navigation visits, 3+ pre-navigation visits, and 5+ pre-navigation visits.
- For COPE patients, Inpatient and Observation activity is presented in pre/post data in addition to ER at 6 months, 12 months, 18 months, and 24 months.
- (Note: pre/post data activity of navigated patients is available for all Memorial Hermann patient activity but not for services rendered at non Memorial Hermann facilities.)

Reasons/rationale for selecting the outcome measure(s):
If patients are educated on the resources available to assist them, the use of the ER as a primary source of healthcare and/or the escalation of medical conditions resulting from the lack of primary care follow-up that end up in the ER should be reduced.

Relationship to other Projects: This project is part of Memorial Hermann's larger plans to expand and develop primary care and specialty care services, while improving access to care and implementing delivery improvements targeted to specific populations (in this case, uninsured and Medicaid patients facing access barriers). It works closely with the greater Houston Safety Net Community.

Relationship to Other Performing Providers' Projects in the RHP: Memorial Hermann Healthcare System reflects the vision of other Performing Providers' in the RHP by increasing individual and family access to healthcare, improving the quality of healthcare, reducing costly ED usage for primary care treatable issues, educating the community on alternative healthcare resources available to them, the importance of a medical home, and reducing overall healthcare costs. It works closely with the greater Houston Safety Net Community.

The ability to properly identify and monitor specific patients with chronic conditions or frequent emergency department utilization trends will allow the region to accurately mange the very large patient base. Patient navigation includes a comprehensive list of tasks as well as unique provider types based on the focus of the initiative and will help the focus of cost containment, emergency

department utilization, and chronic disease management. The Region 3 Initiative Grid in the addendum allows for a cross reference of all initiatives proposed within this concept.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers in the region having similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Approach for valuing project: The valuation of each Memorial Hermann project takes into account the transformational impact of the project, the population served by the project (both number of people and complexity of patient needs), the alignment of the project with community needs, the magnitude of costs avoided or reduced by the project, the degree of collaboration involved in the project, and the sustainability of the project.

Rationale/justification for valuation: The implementation of a patient care navigation program will significantly improve access to both primary and specialty care for targeted patient populations, foster more efficient use of the community's healthcare resources, and ultimately result in reduction of healthcare costs; Memorial took these factors into account when considering the appropriate incentive payment value for this project.

Project Option: 2.10.1 Implement a Palliative Care Program
Performing Provider: Memorial Hermann Hospital/TPI 137805107
Unique Project ID: 137805107.2.2

- Provider: Memorial Hermann Hospital (TMC) is an 860 bed hospital located in Houston, TX and is part of the Houston-Sugarland-Baytown MSA. The MSA population served by Memorial is approximately 6,000,000 people.

- Intervention(s): Memorial will implement a comprehensive palliative care program that will engage patients with life threatening, acute or chronic conditions. The program will also educate health care professionals so they can better advise their patients who need end-of-life care outside an acute care setting.

- Need for the project: Currently, the region only has light adoption of palliative care and there are many hospitals that have no access to palliative care, and there is virtually no access to outpatient palliative care. A palliative care program is needed to improve the quality of life for patients and their families and could be more widely embraced by dying patients and caregivers if they were better educated about this service and made aware of its benefits.

- Target population: There are two types of people the program will target 1) health care professionals and caregivers that will be educated on the services and benefits of palliative care, and 2) patients that would normally seek end-of-life care in an acute care setting so they may be transitioned to home care, hospice or a skilled nursing facility. Memorial expects to be managing a population of approximately 140,000 patients in the next 12 months, and will be enrolling all eligible patients from that population into the palliative care program that meet clinical criteria. In addition, in years two and three of the program, after the infrastructure is implemented, the palliative care program will be enrolling all eligible identified Medicaid/uninsured populations that meet clinical eligibility criteria.

- Category 1 or 2 expected patient benefits: Patients in need of palliative care will benefit from having options to their end-of-life care other than seeking out an emergency room or an acute care setting.

- Category 3 outcomes: IT 13.3 Proportion with more than one ER visit in the last days of life – 10% improvement over baseline. The palliative care program will accelerate the growth and increase the availably of palliative care in the region providing an alternative to ER utilization for patients in the last days of life.

Project Option- 2.10.1 Implement a Palliative Care Program to address patients with end-of-life decisions and care needs: Use of Palliative Care Programs

Unique RHP Project Identification Number: 137805107.2.2
Performing Provider Name/TPI: Memorial Hermann Hospital (Memorial)/137805107

Project Description: Implement a comprehensive palliative care program in cooperation with MHMD that will engage patients through the Primary Care physician network and enroll patients in the palliative care program through physician offices rather than waiting for an acute hospitalization to occur. This project will target patients with life threatening acute or chronic conditions.

Palliative care is a newer medical specialty focusing on improving life and providing comfort to people of all ages with serious, chronic, and life-threatening illnesses. These diseases may include cancer, congestive heart failure, kidney failure, chronic obstructive pulmonary disease, AIDS, and Alzheimer's, and others. This focus also reduces readmissions, health care costs and improves quality of life for families and those providing the care and support to these patients.

Goal(s) and relationship to Regional goal(s):

Project goals:

Provide palliative care services to improve patient outcomes and quality of life. Palliative medicine represents a different model of care, focusing not on care at any cost but on relief and prevention of suffering. Here the priority is supporting the best possible quality of life for the patient and family, regardless of prognosis. Ideally, the principles of palliative care can be applied as far upstream as initial diagnosis of a serious illness, and may be used in tandem with cure-directed treatment. Program goals include: improved pain and symptom control, improved patient satisfaction, reductions in hospital length of stay, reduced cost of care by transitioning appropriate acute care patients to the program, and decreased inpatient mortality.

This project meets the following Region 3 goals:

This project addresses the RHP's goal to "[t]ransform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system."

Challenges and how addressed: Challenges to this project include: upstream application of palliative care principles; application of a model of care with which many patients and families may be unfamiliar; selecting reliable program partners in forming the palliative care program; integrating the program into the current care model; integrating providers who may be resistant to changing their practice methodology; and improving patient satisfaction who are suffering from chronic or terminal illnesses.

Memorial will address the challenge of selecting a reliable program partner by thoroughly analyzing potential community collaborators. Memorial will integrate the program into the current care model by identifying and accepting patients to participate in the supportive and end

of care program. Memorial will also integrate the program by embracing evidence-based care transitions and interventions designed to improve quality of life and satisfaction for patients with chronic and terminal conditions. Furthermore, extensive education will increase physician understanding and will increase patient satisfaction. The palliative care program will address patient satisfaction by developing tailored education, training and standard communication protocols to ensure patients are provided informed choice on the topic of advanced care wishes. Patient advocacy, patient preferences, and patient choice will be a top priority and documentation of patient preference will be recorded within the individual's health record.

5-year expected outcome for provider and patients:

Providers will have better access to and a better understanding of palliative care treatment. Patients will have better satisfaction and quality of life during end of life care.

Starting Point/Baseline: Currently, the Houston area only has light adoption of palliative care as a solution to patient satisfaction and outcomes in patients who have serious or life-threatening acute or chronic illnesses. There are many hospitals that have no access to palliative care, and there is virtually no access to outpatient palliative care services. Because the majority of the milestones and metrics for this project are associated with educating clinical staff on the appropriate use of palliative care, the baseline will need to be assessed by surveying providers in ICU and other specialty areas to care to gauge their current education level.

Rationale:

While end-of-life care was once associated almost exclusively with terminal cancer, today people receive end-of-life care for a number of other conditions, such as congestive heart failure, other circulatory conditions, COPD, and dementia. Further, some experts have suggested that palliative and hospice care could be more widely embraced by dying patients and caregivers if they were better educated about this service and made aware of its benefits. However, these experts say that overly rigid quality standards and poorly aligned reimbursement incentives discourage appropriate end-of-life care and foster incentives to provide inappropriate restorative care and technologically intensive treatments. Experts also note that hospitals, nursing homes, and home health agencies need stronger incentives to provide better access to palliative care and care coordination either directly, themselves, or by contract with outside suppliers. It seems clear that improving care coordination near the end of life can improve care for patients with chronic conditions; however, palliative care should also allow children who are enrolled in either Medicaid or CHIP to receive hospice services without foregoing curative treatment related to a terminal illness.

A palliative care program is needed in an acute care setting in order to improve the quality of life for patients and their families facing the issues associated with life-threatening illness through the prevention and relief of suffering by means of early identification and assessment and treatment of issues including physical, psychosocial and spiritual. Today's healthcare environment has seen an increase in the number of older patients with co-morbidities which results in much sicker patients in the hospital setting. This increase in patient acuity can greatly benefit from palliative care.

This palliative end of life care program will provide value by decreasing inpatient costs, increasing patient and family satisfaction, and improving quality through symptom management and comfort care at end of life. Palliative care consultation services will optimize symptom management, facilitate end-of-life conversations, and assist with timely transitions between sites of care.

Project components:

This project will meet the following required core components:

(a) Develop a business case for palliative care and conduct planning activities necessary as a precursor to implementing a palliative care program;

- Memorial will develop a palliative care business case and conduct planning activities as part of the negotiation and contracting process

(b) Transition palliative care patients from acute hospital care into home care, hospice or a skilled nursing facility;

- Memorial will transition palliative care patients from its facilities to into home care

(c) Implement a patient/family experience survey regarding the quality of care, pain and symptom management, and degree of patient/family centeredness in care and improve scores over time

- will implement a patient/family experience survey as part of this project, to be administered to the population of patients served by the project, and their families.

(d) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

- Memorial will conduct quality improvement activities as part of the hospice program established under this project.

Unique community need identification number the project addresses:

- CN.2 - Inadequate access to specialty care
- CN.6 - Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly
- CN.8-High rates of inappropriate emergency department utilization

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

There is only a small palliative care presence relative to the population of Region 3. This project would be a significant improvement to the healthcare delivery system by addressing that deficiency.

Related Category 3 Outcome Measure(s): OD-13: Palliative Care; IT-13.3 Proportion with more than one ER visit in the last days of life.

Reasons/rationale for selecting the outcome measure(s):

The ER is not the appropriate site of treatment for end of life care. This project will, therefore, reduce the reliance on ERs for patients who are terminally ill.

Relationship to other Projects: This project is part of Memorial Hermann's larger plans to expand and develop primary care and specialty care services, while improving access to care and implementing delivery improvements targeted to specific populations (in this case, terminally ill patients). This project reinforces Project 2.9, Establish/Expand a Patient Navigation System. The palliative care program will redirect terminally and chronically ill patients out of acute care and into the program. This compliments several goals of Project 2.9—decreasing health care costs and increasing high quality patient-centered care.

This project is also related to Project 2.2, Expand Chronic Care Models. Both projects aim to increase efficiency through improved management of chronic conditions. Additionally, these projects are focused on improving care while also specific patients out of acute care centers.

Relationship to Other Performing Providers' Projects in the RHP: The regional need for palliative care is that of upmost priority and is addressed in this initiative. This initiative is unique to Pass 1 initiatives and focuses to outcome measures of pain assessments, treatment preferences, and patients receiving hospice and palliative care. The Region 3 Initiative Grid (addendum) can provide a cross reference to all other initiatives.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Approach for valuing project: The valuation of each Memorial Hermann project takes into account the transformational impact of the project, the population served (both number of people and complexity of patient needs), the alignment with community needs, the magnitude of costs avoided or reduced, the degree of collaboration involved, and the sustainability of the project.

In valuing this project, Memorial took into account the extent to which a palliative and end of life care program would potentially meet the goals of the Waiver (support the development of a

coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and resources and cost necessary to implement the project.

The expansion of palliative care will help address a substantial need in the community for patient-centered care for chronically ill and terminally ill patients. It also advances the Waiver goal of improving outcomes while curbing the risk of healthcare costs.

Memorial Hermann Northwest Hospital

Pass 1

Project Option: 2.2.5 Psych Response Team – Case Management
Performing Provider: Memorial Hermann Hospital System/TPI 020834001
Unique Project ID: 020834001.2.1

- Provider: Memorial Hermann Hospital System (Memorial Hermann) is a 1,164 bed hospital system consisting of 4 campuses in the Houston-Sugarland-Baytown MSA. The system serves a population of approximately 6,000,000 people.

- Intervention(s): The project will provide a 24/7 liaison to act as an adjunct to the Psych Response Team and provide case management of post-discharge behavioral health patients. Case management will identify individuals whose chronic mental illness predicts they will likely have repeat visits to the ER and connect them with case management services for follow-up after discharge.

- Need for the project: Follow-up with behavioral health patients after discharge is a service not currently provided. The patients struggle with non-compliance in prescribed health maintenance activities post-discharge. This project will give behavioral health patients access to necessary follow-up information, as well as a resource for questions regarding their diagnosis and treatment.

- Target population: The target population is all behavioral patients whose conditions are chronic and require individual case management to ensure their treatment is given in a suitable setting and manner. It is estimated that 20% of people in Harris County suffer from behavioral health issues of which 25% are uninsured and another 18% or 701,559 are covered by Medicaid. Of the 18% of residents covered by Medicaid, approximately 8% have received some type behavioral health treatment. Memorial Hermann anticipates this project will address the needs of 500 to 2,000 patients annually.

- Category 1 or 2 expected patient benefits: Most of the target population are frequent patients of the emergency room, which is not an appropriate setting for chronic behavioral health care. This project will provide the patients with more individualized treatment for their conditions and provide them with options for seeking treatment in more appropriate settings.

- Category 3 outcomes: IT 3.8 – The case management project will result in more intensive case management of post-discharge behavioral health patients. The Behavioral Health/Substance Abuse (BH/SA) 30-day readmission rate should see a 10% reduction in BH/SA readmissions by DY5.

Project Option- 2.2.5 Develop care management functions that integrate the primary and behavioral health needs of individuals: Psych Response Team - Case Management

Unique RHP Project Identification Number: 020834001.2.1
Performing Provider Name/TPI: Memorial Hermann Hospital System/020834001

Project Description:

Provide a 24/7 liaison to act as an adjunct to the Psych Response Team to provide more intensive case management of "post-discharge" behavioral health patients to reduce recidivism and increase compliance with follow-up. Emergent Psych Patient Volumes increased 25% in all Memorial Acute Care hospitals from FY 2007 – 2012; which averaged an annual volume increase of almost 5% per year (Total Response Team Volume for FY 2012: 6,924 Patient Encounters). Reasons for increases: ERs identified Primary Care Provider for many indigent; current provider appointment scheduled but symptoms too acute to wait for services; missed appointments, patients have insurance but do not know how to access/navigate Behavioral Care.

Goal(s) and relationship to Regional goal(s):

Project Goal:

Reduce readmission rates and increase compliance with follow-up after discharge through case management.

This project meets the following Region 3 goals:

This project addresses the RHP's goal to "[i]ncrease access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay."

Challenges and how addressed:

Individuals with chronic mental health conditions struggle with non-compliance in prescribed health maintenance activities, such as medicine management, follow-up, and Medicaid enrollment activities. Memorial also anticipates difficulties in recruiting competent behavioral health staff to provide 24/7 services. To address these challenges, Memorial will engage in an aggressive recruitment campaign and deliver services in a manner that places the patient at the center of care decisions wherever possible, which has shown to improve the behavior of non-compliant patients.

5-year expected outcome for provider and patients:

After the project has been fully implemented, Memorial expects that there will be a significant decrease in potentially preventable readmissions.

Starting Point/Baseline: Memorial does not currently have case management component to its psychiatric response team. The volume on patients served by this project will come from the existing psychiatric response team and additional referrals.

Rationale:

This project will give behavioral health patients access to necessary follow up information, as well as a resource for questions regarding their diagnosis and treatment. This source of information will prevent unnecessary ED visits, and will achieve better compliance with follow-up care.

Project components:
There are no required components for this project option.

Unique community need identification number the project addresses:

- CN.5 – Inadequate access to care for veterans and active military, particularly mental health and substance abuse services.
- CN.3 -- Inadequate access to behavioral healthcare.

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

The Psych Response Team Program does not have a case management component in its current state. The primary charge of the Psych Response Team is to evaluate the behavioral health patients in Memorial Hermann Acute Care Hospitals (ED's or medical units) and refer the patient to the appropriate level of care necessary. Follow-up with the patient after discharge is a not service currently provided. The thirteen year history of the Psych Response Team has revealed that patients with psychiatric illnesses are higher utilizes of ED services than the general population. This is in-part due to poor follow-up after discharge. The new initiative, the Case Management adjunct to the Psych Response Team, would identify individuals whose chronic mental illness will likely predict they will have repeat visits to EDs for on-going services and connect with case management services for follow-up after discharge. These services would provide consistent support to ensure compliance with follow-up recommendations and proactively engage the patient in aftercare services in order to prevent reliance on the most expensive level of care in the community, hospital EDs.

Related Category 3 Outcome Measure(s): OD-3: Potentially Preventable Re-Admissions – 30 day Readmission Rates (PPRs); IT-3.8 Behavioral Health/Substance Abuse 30 day readmission rate.

Reasons/rationale for selecting the outcome measure(s):
Coordination of behavioral healthcare has a direct and proven impact on the reduction of potentially preventable readmissions, for both behavioral care issues as well as comorbidities. Therefore, this Category 3 outcome measure in an appropriate measure for the success of this project.

Relationship to other Projects: This project is part of Memorial Hermann's larger plans to enhance healthcare delivery with a model of care management that allows staff to work with at-risk patients with chronic behavioral health disorders. Due to the high incidence of non-compliance with treatment recommendation in the targeted population, these patients are high utilizers of ERs. This project would seek to educate and empower consumers to access and

navigate a healthcare delivery system through the use of appropriate, available, local community resources; to decrease hospital ER visits and to document decreased reliance on emergency rooms as a resource for chronic behavioral healthcare.

Relationship to Other Performing Providers' Projects in the RHP: The behavioral health crisis in Region 3 is considerable and the proposed initiatives in our RHP plan will only imply a small impression into the overall community need for treatment, but is a good start. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is similar to many others in the sense of the category of behavioral health. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Approach for valuing project: The valuation of each Memorial Hermann project takes into account the transformational impact of the project, the population served by the project (both number of people and complexity of patient needs), the alignment of the project with community needs, the magnitude of costs avoided or reduced by the project, the degree of collaboration involved in the project, and the sustainability of the project.

Rationale/justification for valuation: This particular project improves both the quality of healthcare and the efficiency of the delivery system—both important goals of the Waiver. In addition, this project promotes the delivery of behavioral health, which is particularly needed in Region 3.

Project Option: 2.9.2 MHMD Care Management
Performing Provider: Memorial Hermann Hospital System/TPI 020834001
Unique Project ID: 020834001.2.2

- Provider: Memorial Hermann Hospital System (Memorial Hermann) is a 1,164 bed hospital system consisting of 4 campuses in the Houston-Sugarland-Baytown MSA. The system serves a population of approximately 6,000,000 people.

- Intervention(s): Memorial Hermann will implement a comprehensive care management infrastructure for populations attributed to the MHMD Clinical Integrated Network of Patient Centered Medical Home (PCMH) practices. Care Managers will be assigned to these practices to identify frequent ED users and connect patients to primary and preventative care.

- Need for the project: The region suffers from a higher- than- average at risk rate for diseases when compared to the statewide average. Through this project the coordination of care for patients will improve quality of life and healthcare cost effectiveness with decreased ER visits, decreased hospital length of stay and decreased end -of -life hospital admissions.

- Target population: The target population is attributed PCMH patients in Harris, Montgomery and Fort Bend Counties. Memorial Hermann anticipates the number of patients managed by this program will be about 160,000 by April of 2013. We anticipate the number of managed Medicaid/uninsured populations under this program to increase significantly over the next 3 years.

- Category 1 or 2 expected patient benefits: MHMD Case Management will provide support to patient populations who are at most risk of receiving disconnected or fragmented care and will increase patient contact by 15% over baseline measured in DY2.

- Category 3 outcomes: IT 6.1 – Percent Improvement over baseline of patient satisfaction scores (patient's rating of whether patients are getting timely care, appointments and information).

Project Option- 2.9.2 "Other" project option: MHMD Care Management

<u>Unique RHP Project Identification Number</u>: 020834001.2.2
<u>Performing Provider Name/TPI</u>: Memorial Hermann Hospital System/TPI 020834001

<u>Project Description</u>:

Implementation of comprehensive care management infrastructure across the continuum of care for populations attributed to the MHMD Clinical Integrated Network of Patient Centered Medical Home (PCMH) practices, embedding care managers into those practices, tracking patient compliance with referral patterns and assigning Case Managers (CMs) to emergency department, inpatient discharges, and high risk patients. These activities will serve all the attributed PCMH patients in Harris, Montgomery, and Fort Bend counties.

<u>Goal(s) and relationship to Regional goal(s)</u>:

<u>Project Goal(s)</u>:

The goal of this project is to utilize community health workers, case managers, or other types of health care professionals as patient navigators to provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients. Patient navigators will help and support these patients to navigate through the continuum of healthcare services. Patient Navigators will ensure that patients receive coordinated, timely, and site-appropriate health care services. Navigators may assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the Emergency Department to site-appropriate locations. The goal in implementing this Patient Care Navigation program is to improve at-risk patients' experience of the healthcare delivery system by demystifying the often lengthy process of diagnosis and treatment, by assisting with scheduling appointments and keeping up with treatment regimens, and by providing professional support to patients and their families where and when needed.

<u>This project meets the following Region 3 goals</u>:

This project addresses the RHP's goal to "Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system."

<u>Challenges and how addressed</u>:

We have created a model that embeds care managers in the physicians' offices, to create direct responsibility for the population in each practice. Challenges will be centered around timely and accurate data, connectivity of information systems, communication, and creation of clinical data repositories to inform physicians and care managers. Memorial will address those challenges by putting in place processes which will promote timely and accurate data.

<u>5-year expected outcome for provider and patients</u>:

MHMD has a population of patients for which we have accountable responsibility, from Medicare to commercial populations. We anticipate the number of patients will total about 160,000 by January 1, 2013. We expect our care managers will interface heavily with the most chronically ill patients and focus on condition and continuum of care management.

<u>Starting Point/Baseline</u>: Memorial does not currently have a care management program.

<u>Rationale</u>:

Region 3 suffers from higher-than-average at-risk rates when compared to the statewide average. Coordination of care for patients, improves patient quality of life and healthcare cost effectiveness with decreased emergency room visits, decreased hospital length of stay, and decreased end-of-life hospital admissions. Patient navigators help patients and their families navigate the fragmented maze of doctors' offices, clinics, hospitals, out-patient centers, payment systems, support organizations and other components of the healthcare system.

Project components:

Required core project components:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.

- Memorial care managers and information systems will identify frequent patients both at risk for future hospitalization as well as those that are currently high utilizers of ED services. Program elements will focus on proactive management of this population.

b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.

- Memorial will deploy care managers and other allied health personnel as necessary to help at risk patients enroll in chronic disease management programs and engage with their primary care physicians. These efforts will be guided by stratification of the population based on evidence based clinical protocols and outcomes data. This data will suggest the best methods to manage the disease incidence within the population.

c) Connect patients to primary and preventive care

- Chronic disease programs combined with primary care intervention will be a core component of this effort. Memorial programs will focus on the most costly and high incidence patients. These support programs will include education and clinical intervention.

d) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts,

identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

- Create a series of "Joint Operation Councils" that will be multidisciplinary in nature, bringing together physician leadership, care managers, clinical informaticists and other allied health professionals to review progress and opportunities in managing at risk patients. The lessons learned from these forums will serve to inform our activities as we take on additional populations in the Memorial patient centered medical home.

Unique community need identification number the project addresses:
- CN1 – Primary Care

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

This will considerably improve Memorial's capacity to deliver efficient behavioral healthcare.

Related Category 3 Outcome Measure(s): OD-6: Patient Satisfaction IT-6.1 Percent improvement over baseline of patient satisfaction scores: are patients getting timely care, appointments and information.

Reasons/rationale for selecting the outcome measure(s):
Patient satisfaction is a measure of this project's success, as patients receive better access to and better information for services, their satisfaction will improve.

Relationship to other Projects: This project is part of Memorial Hermann's larger plan to expand and develop primary care and specialty care services, while improving access to care and implementing delivery improvements targeted to specific populations (in this case, behavioral health patients).

Relationship to Other Performing Providers' Projects in the RHP: Primary Care/Ambulatory Care clinics are a top priority to Region 3 due to the acuity of the regional patient mix, population concentration, and lack of primary care access points for our patient base. The regional approach of collaboration as well as existing patient referral pattern relationships allowed our team to properly identify the community needs based on the necessity of population, uninsured, and medically underserved patient bases. This program is consistent with our region and similar to numerous initiatives in our RHP plan sharing both concepts as well as outcome measures focused to percent improvement over baseline of patient satisfaction scores, reduction of inappropriate ED utilization, and third next available appointment status. The Region 3 Initiative Grid attached as a RHP Plan addendum reflects a grid of relationship for all initiatives.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have

similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The valuation of each Memorial Hermann project takes into account the transformational impact of the project, the population served by the project (both number of people and complexity of patient needs), the alignment of the project with community needs, the magnitude of costs avoided or reduced by the project, the degree of collaboration involved in the project, and the sustainability of the project.

Rationale/justification for valuation: Establishing a patient navigation program will make more efficient use of the healthcare system and lower costs of care in the community — a vital goal of the Waiver.

Memorial Medical Center

Pass 2

Project Option 2.5.4- Implement other evidence-based project that will impact cost efficiency in an innovative manner: Medication Dispensing Safety & Efficiency
Unique RHP Project ID: 137909111.2.1
Performing Provider Name/TPI: Memorial Medical Center / 137909111
Project Summary:
Provider:
Memorial Medical Center is a county-owned, 25 bed Critical Access Hospital and serves as the only hospital for Calhoun County. Located on the Gulf Coast, Memorial Medical Center serves 60% of the 21,382 County residents. With a tax base of $13,972,000, Memorial Medical Center was able to provide more than $8 million in charity care (includes uncompensated) during FY 2012.

Volume Statistics – 11 months Year to date 2011 - 2012	Patient Payer Mix for Inpatient Services	Patient/Community Demographics
Hospital admissions- 1056 Births (babies delivered)- 98 Emergency visits- 9084 Outpatient visits- 13,430 Laboratory procedures- 224,562	Medicaid and CHIP- 18% Medicare- 53% Commercial Insurance- 19% Uninsured, Charity, Indigent Care- 10%	Hispanic- 47.1% African American- 3.3% Caucasian- 44.4% Asian- 4.5% American Indian- 0.7%

Intervention(s):
The automation of a medication dispensing system significantly increases pharmacist and nursing staff time to spend on patient care and education; reduce pick errors for wrong medications increasing patient safety; and facilitate cost containment/savings due to the addition time allowed for pending expired medication to be disposed compared to the regulations for disposal via a manual model, efficiency in labor and reduction in needed supplies.
Need for the project:
The purpose of this project is to provide cost containment, improved patient care and safety. Currently, our nursing staff spends 1.5 to 2 hours per patient ordering, receiving and administering medication. With a dispensing system in place, 95% of the medications administered in a care area would be stored for ready access. This method allows for "now orders" on medication which in return leads to better patient services by keeping the patient more comfortable. Pharmaceutical automation will provide 99.99% prescription dispensing accuracy for improved medication safety.
Target Population:
All patients within the system with may benefit from this project (Medicaid and CHIP-18% / Medicare- 53%), specifically those with chronic diseases.
Category 1 or 2 expected patient benefits:
Through the medication dispensing project, MMC plans to provide increased efficiency and safety in delivery of pharmaceutical services along with increased access to one-on-one nursing care. Net cost savings are approximately $712,000 through use of automation as compared to the current manual prescription processing.
Category 3 outcomes:
OD-5: The value of the project is based on cost avoidance, projecting savings associated with reducing the costs incurred in filling 120,000 current patient prescriptions on an annual basis all the while improving patient satisfaction and experience. In DY5, cost savings result from a 31% decrease from baseline in the average labor cost per prescription using the total salaries and benefits/total number of MMC automated prescriptions as found on the monthly operating statement compared to baseline. The cost savings are a result of automation efficiencies.

Project Option 2.5.4- "Other" project option: Implement other evidence-based project that will impact cost efficiency in an innovative manner: Medication Dispensing Safety and Efficiency

Unique RHP Project Identification Number: 137909111.2.1
Performing Provider Name/TPI: Memorial Medical Center / 137909111

Project Description:
Currently, Memorial Medical Center has no automated prescription counting technology. Annually, 120,000 prescriptions are counted manually, using only a counting tray and spatula. According to HealthMEDX, on average, 74% of a typical nurse's workday is spent outside of the patient room on non-value added activity. Currently, our nursing staff spends 1.5 to 2 hours per patient ordering, receiving and administering medication. With a dispensing system in place, 95% of the medications administered in a care area would be stored for ready access. This method allows for "now orders" on medication which in return leads to better patient services by keeping the patient more comfortable. To avoid errors during the administration of medications, we would implement bedside bar-code scanning utilizing Computers on Wheels (COWS). Further, by using a dispensing system with COWS, nursing staff will have more time to spend with the patients assisting with their recovery process resulting in decreased length of stay and cost savings.

The benefits of a Medication Dispensing System include improved patient services, safety, and cost efficiency. Focused on safety, high-risk drugs are stored in high-security pockets allowing less room for error and threat of diversion minimized. Since only one pocket opens up with one medication, nurses are restricted from the wrong medication during dispensing or take one that they aren't authorized to take. The ability to layout medications in the order allows staff to keep look-alike and sound-alike drugs far away from each other which substantially reduces the risk of "pick errors". This type of "checks and balances" further assures patients receive the correct medication in most efficient process possible. Pharmaceutical automation will provide 99.99% prescription dispensing accuracy for improved medication safety.

Project managers will consist of an interdisciplinary team of pharmacy, IT, and planning representatives.

Goals and Relationship to Regional Goals:
Project Goals:

- Implement an in-house automated medication dispensing system that can process up to 10,000 prescriptions per day with the capability of increasing volume at a negligible cost.
- Decreasing the average labor cost per prescription from baseline.
- Engineering pharmacy operations to develop a patient centered delivery model ensuring comprehensive medication management for optimal outcomes.
- Enhancing patient satisfaction by decreasing pharmacy wait times and increasing nursing and pharmacy access.
- To become a provider of choice for our patients and for the medically underserved individuals and families of Calhoun County.

This project meets the following regional goals:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction. The MMC medication dispensing system will improve efficiency in the pharmacy and improve patient satisfaction with improved wait times and patient adherence.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system. The MMC Medication Dispensing project will allow on site pharmacists to focus on clinical patient centered activities such as Medication Therapy Management. These programs promote patient adherence and wellness as well as decrease emergency room visits for refills.
- Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes. Automation technology represents best practices currently in use by the Veterans Administration, the United States Armed Services, as well as other public hospitals and retail pharmacy services.

Challenges:

- Funding – this is addressed by the DSRIP project.
- Software operating system - the pharmacy software operating system will be transitioned to operating system that supports medication dispensing and interfaces with CPSI (our current patient care system).
- Project development – Due to the large scale nature of the project, the medication dispensing DSRIP project will be supported by a multidisciplinary team including; an Information Technology (IT) project manager, Planning project manager and Pharmacy project manager.

5 -Year expected outcome for Provider and Patients: Through the medication dispensing project, Memorial Medical Center plans to provide increased efficiency and safety in delivery of pharmaceutical services along with increased access to one-on-one nursing care. Net cost savings are approximately $712,000 through use of automation as compared to the current manual prescription processing. This estimate is based on the current 120,000 prescription volume.

Starting Point/Baseline:
Currently, all prescriptions (approximately 120,000 annually) at Memorial Medical Center are manually filled on site by frontline pharmacy staff with no available automation. Patients and Nursing Staff either wait for their prescriptions or come back at a later date. Efficiency, safety and access would be greatly enhanced with the creation of a dispensing system.

Rationale:

Project option 2.5.4, "Other" project option: Implement other evidence-based project that will impact cost efficiency in an innovative manner, was chosen to justify the pharmacy prescription processing redesign for cost containment. The Memorial Medical Center Department of Pharmacy is committed to providing high quality pharmacy services in the most cost effective and efficient manner through implementation of an automated medication dispensing system. Memorial Medical Center serves approximately 28,000 unduplicated lives, and the Department of Pharmacy currently fills approximately 120,000 prescriptions per year at one pharmacy located in the hospital. Pharmaceutical services at MMC are currently 100% manual. It is expected that approximately 90% of the total Memorial Medical Center prescription volume could be efficiently processed by an automated dispensing systems. These medications would consist primarily of maintenance medications for chronic disease conditions. The automated system would afford time for the on-site clinical pharmacist to provide expanded clinical services as such as Medication Therapy Management (MTM), and nursing staff to extend patient care. These clinical value added benefits enhance the efficiency and significance of the redesign. Furthermore, the MMC Medication Dispensing Project will lend to cost containment as associated with expired medications. Under a non-automated model, pharmacists are required to pull expiring medications three months before their expiration date. Although still useful, these medications are destroyed long before necessary causing waste and financial loss. Under an automated system, medications are pulled days before their due date resulting in a cost savings.

Project Components:
No core components are required for this initiative.

Milestones & Metrics:
Process Milestones and Metrics: P-X2, P-X2.1
Improvement Milestones and Metrics: I-X8, I-X8.1

Unique Community need identification numbers the project addresses:
CN.11 High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease, including cancer, diabetes, obesity, cardiovascular disease, asthma and AIDS/HIV. The automated prescriptions filled at MMC are primarily refills for chronic disease conditions. The efficiencies gained with this project will allow the pharmacist on site, to focus on urgent need prescriptions, e.g. antibiotics, pain, seizure medications. On site pharmacist will also have more time to focus on clinical functions such as Medication Therapy Management (MTM).

MMC's primary service area is almost exclusive to the Port Lavaca zip code. The secondary service area includes the remainder of Calhoun County and the southwestern portion of adjacent Matagorda County. To better understand the community's needs and determine the steps MMC needs to take to adequately serve the region's patients, in 2010 MMC contracted with BR Healthcare Services, Inc. (BRHS) to conduct an analysis of MMC's current market, the primary and secondary service area, demographics, and outmigration.[240] The study found that 73% of patients served by MMC lived in the Port Lavaca zip code area, while 18% of patients lived in Calhoun County and Palacios. During the time period of the study, the patient population included 33.6% who are covered by Medicare; 16.4% who are covered by Medicaid; 31.1% who

[240] BR Healthcare Services, Inc., Memorial Medical Center Market & Service Area Development Report, October, 2010.

are insured by a commercial plan; and 18.9% who are uninsured, charity and indigent care patients.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
The automation of a medication dispensing system significantly increases pharmacist and nursing staff time to spend on patient care and education. With hundreds of prescriptions filled per day an automated system also reduces pick errors for wrong medications increasing patient safety. In addition, an automated system facilitates cost savings due to the addition time allowed for pending expired medication to be disposed compared to the regulations for disposal via a manual model.

We will improve efficiencies by increasing the percentage of prescriptions filled by the automated dispensing system. There is currently no automation at Memorial Medical Center, therefore the baseline percentage of prescriptions filled via an automated system is 0%. The first partial year consisting of 4 months automated medication dispensing, ending in DY3, is expected to meet a goal of filling 20% of the total monthly prescription volume at the facility. We anticipate a cost savings in labor of $32,850 over baseline from implementation in the Emergency Department alone.

Approximately 50% of the total prescription volume is for chronic disease medications. In DY4, the percent of prescriptions filled through an automated system will increase by 70% to a goal of 90% over baseline with the addition of inpatient departments. We anticipate a cost savings in labor and supplies equal to $496,800. In DY5, the percent of automated prescriptions filled will remain at 90% over baseline. However, the recapture costs through tracking medication dispensed in the Emergency Department and the retention of expiring medication until their due date will add a total cost savings through the lifetime of the Waiver to $712,000.

Related Category 3 Outcome Measure(s):
OD-5 Cost of Care
IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery
The automated dispensing redesign for pharmacy services at Memorial Medical Center will result in cost savings through increased efficiencies in the delivery of pharmaceutical services and availability of nursing staff to provide value added tasks for the patients. Automation will help keep labor costs in check while our frontline staff can focus on clinical efforts for our patients. The pharmacist will be readily available for counseling patients on medication adherence.

We will utilize the Cost Benefit Analysis to demonstrate costs and outcomes in monetary units. We propose incremental cost savings as the project goes from zero automation at baseline in DY2 to 90% automation by the end of DY5. We expect to decrease the average labor cost per prescription by 7% by the end of the initial DY3 implementation year. In DY4, we expect a 19% decrease from baseline in the average labor cost per prescription. In DY5, we expect a 31% decrease from baseline in the average labor cost per prescription. We will use a report to be generated from the new software operating system to determine the percentage of prescriptions filled through the automated system. The monthly operating statements will be used to show

comparative cost savings in total salaries and benefits and the total number of prescriptions filled at MMC. Projected cost savings are based on current 120,000 annual prescription volume.

Relationship to other Projects:
The increase of primary care and specialty care will naturally result in additional ambulatory care encounters for our region patient base. The ambulatory initiatives cover items such as laboratory, PT/OT, social work, etc. and are a necessity of our patients to ensure a comprehensive treatment for access as well as cost avoidance. The Region 3 initiative grid in the addendum reflects all ambulatory operations initiatives.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:
This project is a supporting pillar for one of the main objectives of the 1115 Waiver; increasing access to primary care for the underserved population in Calhoun County. The value of the project is based on cost avoidance, projecting savings associated with reducing the costs incurred in filling 120,000 current patient prescriptions on an annual basis. Based on the increase in primary care volumes addressed in another Memorial Medical Center Waiver project, further growth in volume to prescriptions is projected. Despite this increase in prescription volume, processing costs are projected to decrease in total with the addition of the automated medication dispensing function. The prompt availability of needed prescriptions for our underserved patients, particularly those with chronic disease that can be managed effectively with appropriate pharmaceuticals, will result in fewer emergency room visits for public and private hospitals located in the service area, and will also help to prevent future downstream inpatient admissions.

We value this project based upon labor costs for Pharmacist and Nursing staff. Further, cost savings generated by the elimination of labeling medications and destroying medications before their expiration date. In addition, the value associated with one-on-one patient care, medication counseling and the elimination of potentially fatal pick errors adds another layer of value to the patients we serve.

Memorial Medical Center

Pass 3

Project Option 2.4.1- Improving the Patient Experience – The AIDET or similar project
Unique RHP Project ID: 137909111.2.2/Pass 3
Performing Provider Name/TPI: Memorial Medical Center / 137909111
Project Summary:
Provider:
Memorial Medical Center is a county-owned, 25 bed Critical Access Hospital and serves as the only hospital for Calhoun County. Located on the Gulf Coast, Memorial Medical Center serves 60% of the 21,382 County residents. With a tax base of $13,972,000, Memorial Medical Center was able to provide more than $8 million in charity care (includes uncompensated) during FY 2012.

Volume Statistics – 11 months Year to date 2011 - 2012	Patient Payer Mix	Patient/Community Demographics
Hospital admissions- 1056 Births (babies delivered)- 98 Emergency visits- 9084 Outpatient visits- 13,430 Laboratory procedures- 224,562	Medicaid and CHIP- 16.4% Medicare- 33.6% Commercial Insurance- 31.1% Uninsured, Charity, Indigent Care- 18.9%	Hispanic- 47.1% African American- 3.3% Caucasian- 44.4% Asian- 4.5% American Indian- 0.7%

Intervention(s):
Delay in seeking health care due to unsatisfactory patient experiences with customer service.

Need for the project:
The purpose of this project is to reduce patient anxiety and increase patient satisfaction. Process and measures will be implemented to measure and improve patient experiences resulting improved communication. With improved satisfaction, there is potential to increase the level of care integration and coordination of the patient/doctor relationship and lead to better health and better patient experience of care..

Target Population:
All patients within the system with may benefit from this project (Medicaid and CHIP-16.4% / Medicare- 33.6%), specifically those with chronic diseases.

Category 1 or 2 expected patient benefits:
Over the course of this project, 100% full time and part time employees will participate in a patient experience training to improve patient satisfaction. By the end of DY 5, patient data experience will be available internally and externally for general public access and accountability. By doing so, we will improve the health of our clients by providing more timely access to care and coordinating treatment and follow-up care that isn't available when patients seek treatment through the Emergency Department.

Category 3 outcomes:
OD-6: Because the community we serve has an insufficient number of providers and patients are often unable to obtain appointments in a timely manner, the priority goal for this project is ensuring patients receive care when they need it and without significant delays, which will result in improved health outcomes and patient satisfaction. In DY5, patient experience at the Hospital Based Clinic shall have improved in deficient areas of timely care, appointments and information by 10% by the end of the waiver.

Project Option 2.4.1 – Develop and implement a structured patient experience training program: Improving the Patient Experience – The AIDET or similar Project.

Unique RHP Project Identification Number: 137909111.2.2 /Pass 3
Performing Provider Name/TPI: Memorial Medical Center / 137909111

Project Description:
Memorial Medical Center will develop and implement a structured patient experience training program: Improving the Patient Experience – The AIDET Project.
Memorial Medical Center is a 25-bed rural critical access hospital located in Calhoun County. The population of Calhoun County is 21,381 per the 2010 Census. The community of Port Lavaca has a population of 11,500 per the 2010 Census. Memorial Medical Center is the only hospital within Calhoun County. We provide basic services including Emergency Room, Diagnostic Imaging, Laboratory, Rehabilitation, Swing Bed, Surgery, ICU and Obstetric services.
Memorial Medical Center plans to roll out The AIDET Project or similar training program to all new and existing full-time and part-time employees. The AIDET program was developed by the Studer Group. It is a powerful communication tool. AIDET is an acronym for Acknowledge, Introduce, Duration, Explanation and Thank You. When interacting with patients, gaining trust is essential for obtaining patient compliance and improving clinical outcomes. The project goal is to reduce patient anxiety and increase patient satisfaction which will result in positive outcomes for the patient.
We expect to incur scheduling difficulties amongst the targeted population; however, in addition to the live training program that will be conducted, we will also implement a self-study web-based program, so we can accommodate various schedules. By the end of the waiver, our expected outcome is to have 100% of our full-time and part-time employees trained on the patient experience training program, and for the employees and public to be educated on our efforts of improving patient satisfaction for our patients and their families. This project helps achieve the overall goals of the region by promoting positive healthcare experiences throughout the region which will ultimately improve the health of patients and decrease healthcare costs.

Starting Point/Baseline:
The starting point/baseline for this project will be the number of new full-time and part-time employees and the number of existing full-time and part-time employees. As of October 1, 2012, we are expecting to train 141 full-time employees and 60 part-time employees. The number of new full-time and part-time employees is unknown at this time. The time period for this baseline is one year from October 1, 2012 – September 30, 2013; however, we will continue to provide patient experience training even after this date in order to continue our quality improvement process.

Rationale:
Our rationale for selecting project option 2.4.1 Implement processes to measure and improve patient experience was a result of the need for improved communication between patients and healthcare providers. We believe if we can increase patient satisfaction, it has the potential to increase the level of care integration and coordination of the patient/doctor relationship and lead to better health and better patient experience of care.

Project Components:

All core components will be addressed in this project:

a) Organizational integration and prioritization of patient experience;

b) Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience;
c) Implementing processes to improve patient's experience in getting through to the clinical practice; and
d) Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures,

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

We believe the need for this project could fall under several of the needs reported in the RHP #3 Community Needs Assessment list, but it best is categorized under CN.23 Lack of patient navigation, patient and family education and information programs. If a patient has a good experience, we believe they will continue to actively engage themselves in their future health related care which will ultimately lead to positive outcomes and lower overall healthcare costs. We are not aware of any related activities to this project that are funded by the US. Department of Health and Human Services currently ongoing or coming up in the future.

Related Category 3 Outcome Measure(s):

OD-6 Percent improvement over baseline of patient satisfaction scores.

Reasons/rationale for selecting the outcome measures:

We believe if we can decrease patient anxiety and improve patient satisfaction in the rural setting when the patient is referred to the urban setting for extended/expanded healthcare that they will be more receptive and compliant to their healthcare needs which will ultimately lead to positive outcomes, improved patient satisfaction and ultimately lower healthcare costs. When patients perceive healthcare as a positive process, they will practice healthy lifestyles which results in lower healthcare costs.

We will focus on the stand-alone measure that will monitor an increase in patient satisfaction scores for the measure - patient is getting timely care, appointments, and information. We believe this measure is very important to the overall patient experience. These outcomes are important to our hospital because we believe if patients felt comfortable with the timeliness of their care, they would be less anxious about healthcare processes and more open to working with the healthcare providers. We believe by improving the patient experience through our Category 2 project – developing and implementing a structured patient experience training program, the patient will feel optimistic about their healthcare experience and take care of themselves. Again, we believe by focusing on patient satisfaction for every patient, it will improve the health of low-income population as well as the total population.

Relationship to other Projects: 137909111 1.1 Hospital Based Clinic improving access to Primary and Specialty Care.

Relationship to Other Performing Providers' Projects in the RHP: Innovation is key to the transformation of healthcare in our community. The consistency of innovation in our region allows for increased improvements based on research trends, patient need, and provider availability. The waiver funding allows for innovation in specific areas and all innovative projects included in the plan are similar in the fact of program redesigns for historic treatments, and focus to chronic condition outcome measures such as central line infections. The Region 3 initiative grid in the addendum can provide a side by side comparison of all projects that directly relate to innovation.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's healthcare system.

Project Valuation: We valued the project based on cost and benefits to our organization. We believe if we can reduce patient anxiety through education, the patient will have positive experiences and positive outcomes which will make them to want to take care of themselves by leading healthier lives, obtaining preventative healthcare and seeking medical help at appropriate times.

Project Option 2.4.1- Improving the Patient Experience – Hospitalist Model
Unique RHP Project ID: 137909111.2.3/Pass 3
Performing Provider Name/TPI: Memorial Medical Center / 137909111
Project Summary:
Provider:
Memorial Medical Center is a county-owned, 25 bed Critical Access Hospital and serves as the only hospital for Calhoun County. Located on the Gulf Coast, Memorial Medical Center serves 60% of the 21,382 County residents. With a tax base of $13,972,000, Memorial Medical Center was able to provide more than $8 million in charity care (includes uncompensated) during FY 2012.

Volume Statistics – 11 months Year to date 2011 - 2012	Patient Payer Mix	Patient/Community Demographics
Hospital admissions- 1056 Births (babies delivered)- 98 Emergency visits- 9084 Outpatient visits- 13,430 Laboratory procedures- 224,562	Medicaid and CHIP- 16.4% Medicare- 33.6% Commercial Insurance- 31.1% Uninsured, Charity, Indigent Care- 18.9%	Hispanic- 47.1% African American- 3.3% Caucasian- 44.4% Asian- 4.5% American Indian- 0.7%

Intervention(s):
Due to the healthcare provider shortage, patients needing admission through the Emergency Department often experience delay in care.

Need for the project:
The purpose of this project is to eliminate the delay in care from the ER to inpatient services. MMC will research, design and implement if found to be effective a hospitalist model to increase productivity and access to care for patients involving both physicians and mid-level providers. Currently, patients are admitted to their primary care physician or the primary care physician on call for the ER. MMC works under contract with a team of rotating ER physicians resulting in issues with admitting patients and maintaining a care plan.

Target Population:
All patients within the system with may benefit from this project (Medicaid and CHIP-16.4% / Medicare- 33.6%), specifically those with chronic diseases.

Category 1 or 2 expected patient benefits:
Over the course of this project, the potential to yield improvements in the level of care integration and coordination for patients can ultimately lead to better health and better patient experience of care. Hospitalist will ensure patients' needs are met within a timely manner reducing complications, lengths of stay, and the costs providing care.

Category 3 outcomes:
OD-6: Because the community we serve has an insufficient number of providers and patients are often unable to obtain appointments in a timely manner, the priority goal for this project is ensuring patients receive care when they need it and without significant delays, which will result in improved health outcomes and patient satisfaction. Through a Hospitalist Model we anticipate a 10% decrease in admission times by the end of the waiver.

Project Option 2.4.1 – Redesign to Improved Patient Experience

Unique RHP Project Identification Number: 137909111.2.3/Pass 3
Performing Provider Name/TPI: Memorial Medical Center / 137909111

Project Description:
Hospitalist Model – Implementing processes to improve patient's experience

Memorial Medical Center is a 25-bed rural critical access hospital located in Calhoun County. The population of Calhoun County is 21,381 per the 2010 Census. The community of Port Lavaca has a population of 11,500 per the 2010 Census. Memorial Medical Center is the only hospital within Calhoun County. We provide basic services including Emergency Room, Diagnostic Imaging, Laboratory, Rehabilitation, Swing Bed, Surgery, ICU and Obstetric services.

Under this project, Memorial Medical Center will research, design, and implement (if found to be effective) a hospitalist model to increase productivity and access to care for patients, involving both physicians and mid-level providers. Under the current care model at our hospital, patient care is managed by individual primary care physicians who work in tandem with the hospital staff for their specific patients. Currently, there is a shortage of primary care physicians in Calhoun County and statewide that is causing lack of access to care. This lack of access is causing increased length of stay and decreased patient satisfaction. We would like to evaluate the possibility of implementing a hospitalist model, under which the hospital would have a staff of physicians and mid-level providers to treat hospital patients, in lieu of having primary care physicians make calls and visits on a fractured basis. Our research will determine if an all-physician hospitalist model would be appropriate or some type of mixed-model with mid-level providers is more effective. We expect to determine if and how much a hospitalist model will improve the patient experience by creating a more stable continuity of care during a hospital stay and providing easier access to doctors and nurses. Assuming the program is feasible and desirable, we expect that the move to a hospitalist model will improve patient satisfaction by reducing the wait time for treatment decisions, and will improve the documentation of patients' diagnoses, treatment, and outcomes. The model should also improve the quality of life for physicians as they would no longer have to be on call or round in the middle of the night. Challenges include: high cost of providing the nurses and physicians; determining whether the hospitalist model will make a positive impact for patients; convincing primary care physicians that this model is better for their patients; accurately measuring the change in patient satisfaction.

Starting Point/Baseline:
Currently, patients are admitted to their primary care physician or the primary care physician on-call for the emergency department. Memorial Medical Center currently works under contract with an Emergency Department team of doctors on rotation. With a rotation scenario, a patient admitted under one doctor may not have the same physician the next day delaying care. Further, due to the shortage of primary care physicians, our physicians are over-burdened with their practice and often do not see patients in a timely manner. This causes delays in treatments which can lead to poor outcomes and increased lengths of stay. Occasionally, patients have been transferred to other towns because no primary care physician was available to admit them which resulted in delay of care.

Rationale:
Implemented hospitalist projects have the potential to yield improvements in the level of care integration and coordination for patients and ultimately lead to better health and better patient experience of care. Currently, there is a shortage of primary care physicians in Calhoun County and statewide that is causing lack of access to care. This lack of access is causing increased lengths of stay and decreased patient satisfaction. We expect that the move to a hospitalist model will improve patient satisfaction by reducing the wait time for treatment decisions, and will improve the documentation of patients' diagnoses, treatment, and outcomes. Hospitalists will manage the acute care of patients and expedite the care of patients within the hospital setting. Hospitalists will ensure patients' needs are met within a timely manner. Because hospitalists are on duty 24 hours a day, they are fully available to patients from admission to discharge. This reduces complications, lengths of stay, and the costs of providing care. This model will relieve some primary care physicians from rounding in the hospital, thus enabling greater patient access to care as physicians will be able to spend more time in their practice.

Project Components:
All core components will be addressed in this project:

a) Organizational integration and prioritization of patient experience;

b) Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience;
c) Implementing processes to improve patient's experience in getting through to the clinical practice; and
d) Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures,

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
We believe the need for this project could fall under several of the needs reported in the RHP #3 Community Needs Assessment list, but it best is categorized under CN.1 Inadequate access to primary care; CN2 Inadequate access to specialty care; CN6 Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly; and CN7 Insufficient access to care coordination practice management and integrated care treatment programs.

If a patient has a good experience, we believe they will continue to actively engage themselves in their future health related care which will ultimately lead to positive outcomes and lower overall healthcare costs. We are not aware of any related activities to this project that are funded by the US. Department of Health and Human Services currently ongoing or coming up in the future.

Related Category 3 Outcome Measure(s):
OD-6 Percent improvement over baseline of patient satisfaction scores.

Reasons/rationale for selecting the outcome measures:
We believe if we can decrease patient anxiety and improve patient satisfaction in the rural setting when the patient is referred to the urban setting for extended/expanded healthcare that they will be more receptive and compliant to their healthcare needs which will ultimately lead to positive outcomes, improved patient satisfaction and ultimately lower healthcare costs. When patients perceive healthcare as a positive process, they will practice healthy lifestyles which results in lower healthcare costs.

We will focus on the stand-alone measure that will monitor an increase in patient satisfaction scores for the measure - patient is getting timely care, appointments, and information. We believe this measure is very important to the overall patient experience. These outcomes are important to our hospital because we believe if patients felt comfortable with the timeliness of their care, they would be less anxious about healthcare processes and more open to working with the healthcare providers. We believe by improving the patient experience through our Category 2 project – Hospitalist Model, the patient will feel optimistic about their healthcare experience and take care of themselves. Again, we believe by focusing on patient satisfaction for every patient, it will improve the health of low-income population as well as the total population.

Relationship to other Projects: 137909111 1.1 Hospital Based Clinic improving access to Primary and Specialty Care.

Relationship to Other Performing Providers' Projects in the RHP: Innovation is key to the transformation of healthcare in our community. The consistency of innovation in our region allows for increased improvements based on research trends, patient need, and provider availability. The waiver funding allows for innovation in specific areas and all innovative projects included in the plan are similar in the fact of program redesigns for historic treatments, and focus to chronic condition outcome measures such as central line infections. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's healthcare system.

Project Valuation: We valued the project based on cost and benefits to our organization. We believe if we can reduce patient anxiety through access to the right care at the right place and in the right setting, the patient will have positive experiences and positive outcomes which will make them to want to take care of themselves by leading healthier lives, obtaining preventative healthcare and seeking medical help at appropriate times.

The valuation of each Memorial Medical Center project takes into account the transformational impact of the project, the population served by the project (both number of people and complexity of patient needs), the alignment of the project with community needs, and the magnitude of costs avoided or reduced by the project. In particular, this project has been valued

based on the logistical work required to change patterns of care in the inpatient setting, as well as the potential for quality improvement and patient experience improvement resulting from a successfully implemented hospitalist program.

Mental Health and Mental Retardation Authority of Harris County

Pass 1

Project Option 2.4.1- 2.15 INTEGRATE PRIMARY AND BEHAVIORAL HEALTH CARE SERVICES: COLLABORATIVE PRIMARY MEDICAL AND BEHAVIORAL HEALTH CARE

Unique RHP Project ID: 113180703.2.1/Pass 3

Performing Provider Name/TPI: MHMRA of Harris County / 113180703

Project Summary:

Provider**:** The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received any agency service in FY12, 36.5% were medically indigent and 51.9% had Medicaid. Of those who received mental health services in FY12, such as those being proposed in this project, 55% were medically indigent and 34.9% had Medicaid.

Intervention(s): MHMRA will design, implement, and evaluate a care management program that integrates primary and behavioral health care services.

Need for the project: There is a significant connection between mental health conditions and physical health. In 2011, about 68% of MHMRA patients reported having a medical condition, including hypertension, cardiovascular disease and diabetes. Psychiatric medications exacerbate the problem because they are associated with weight gain leading to obesity and high triglyceride levels, known risk factors for cardiovascular disease. Adults with serious mental illnesses are known to have poor nutrition, high rates of smoking, and a sedentary lifestyle—all factors that place them at greater risk for serious physical disorders, including diabetes, cardiovascular disease, stroke, arthritis and certain types of cancers. Despite such extensive medical needs, adults with serious mental illnesses often do not receive treatment for their chronic medical conditions.

Target population: MHMRA patients who are not already seen by a primary care physician. It is anticipated the program will provide service for about 1000 patients.

Category 1 or 2 expected patient benefits: MHMRA will

- Increase percent of individuals receiving both physical and behavioral health care at the established locations by 10% of baseline by DY5. [I-8.1]
- Increase percent of individuals with a treatment plan developed and implemented with primary care and behavioral health expertise by 5% over baseline by DY%. [I-9.1].

Category 3 outcomes: MHMRA expects to increase one domain of patient satisfaction (TBD) by 10% from baseline by DY5.

2.15.1 Integrate primary and behavioral health care services: Collaborative Primary Medical and Behavioral Health Care

RHP Project Number: 113180703.2.1
Performing Provider/TPI: Mental Health and Mental Retardation Authority of Harris County/ 113180703

Project Description:
The Mental Health and Mental Retardation Authority (MHMRA) of Harris County will design, implement, and evaluate a care management program that integrates primary and behavioral health care services.

The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those who received mental health services in FY12, such as those being proposed in this project, 55% were medically indigent and 34.9% had Medicaid.

MHMRA proposes a collaborative primary and behavioral health program to address the needs of those patients with chronic physical and mental health problems. Over the past three decades, the importance of addressing both the physical and behavioral health needs of individuals has become an essential component of collaborative care delivery. In order to provide collaborative health care for the population served, MHMRA of Harris County proposes to integrate primary care and behavioral health care services in a total of 8 locations in Harris County. Four primary care teams will be placed within four of the MHMRA's mental health clinics; and four MHMRA mental health teams (psychiatrists, nurses, therapists, counselors, case managers, rehabilitation clinicians) will be placed in public health/safety net facilities (e.g., FQHCs, public health clinics, Harris Health System outpatient clinics etc) to provide integrated primary and behavioral health care services.

Goals and Relationship to Regional Goals:
Overall goals of the proposed program include improving mental health and medical treatment access for MHMRA patients via a collaborative treatment model. Specifically, there are several goals including mental and physical health outcomes for the proposed program. For the patient, the goals are improved health outcomes such as decreased blood pressure and blood sugar, preventative screenings for early disease detection, increased health literacy and increased adherence to medical treatment. Furthermore, goals related to mental health include improved adherence to psychiatric medications and treatment, early detection of relapses or non-compliance, improved medication adherence through better communication between different prescribers, hopefully reducing the side effects of psychotropic medications. A goal for the providers is a reduced no-show rate, increased collaboration between providers, improved patient input, making the patient a vested partner in improving health and behavioral health outcomes. Furthermore, both providers and the patient should see a reduction in costs through the collaborative efforts, the one-stop service provision and the increased kept appointments.

Regional Goals: Through the proposed program, MHMRA of Harris County will address areas of regional concern. The specific regional goal that will be addressed is increasing access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay with the outcome of reduced utilization of Emergency Centers as primary care providers for the seriously mentally ill.

Challenges:

Several challenges face the proposed implementation of collaborative teams, including patient issues, provider issues, and systemic problems. MHMRA patients are typically difficult to engage; have higher rates of mortality as compared to the general population; they frequently demonstrate treatment compliance issues, difficulties with follow-through, lack of resources, population diversity, and issues related to management of their psychiatric conditions.

As the A Performing Provider, MHMRA also faces several challenges to implementing a collaborative program, including attracting providers, developing a collaborative environment, incentivizing patients to use program and engaging and educating patients to improve health literacy and health seeking behaviors. Systemic issues will also present challenges to a collaborative approach, such as billing for two providers who may meet with a patient together, the high number of uninsured patients, limited access to primary care services resulting in subsequent over-utilization of ER for services, and systems for sharing health information with multiple care providers.

5 Year Expected Outcome:

MHMRA hopes that at the end of the 5 year DSRIP program there will be notable improvements in patient-centered collaborations, improved medical and mental health outcomes for patients, and a significant reduction in ER services utilization by this population in the region due to improved access to primary care services. The milestones and metrics attached will address yearly goals toward the five year outcomes.

Starting Point/Baseline:

Currently, a co-location program exists at El Centro De Corazon which has provided the opportunity to serve the medical needs of MHMRA patients who are also seen for psychiatric services in a mental health outpatient clinic. Current clinical space within the four locations will be assessed to determine if additional space will be needed to place the primary health care team. It is hopeful local FQHC programs will have available space for the four mental health teams proposed; however, additional space within these programs may need to be leased.

Rationale:

In 2011 about 68% of MHMRA patients reported having a medical condition, 19% had hypertension and 7% had diabetes; yet, though cardiovascular diseases, such as high blood pressure, are very prevalent amongst the mentally ill population, they are also widely left undetected. Psychiatric medications exacerbate the problem because they are associated with weight gain leading to obesity and high triglyceride levels, known risk factors for cardiovascular disease. Adults with serious mental illnesses are known to have poor nutrition, high rates of smoking, and a sedentary lifestyle—all factors that place them at greater risk for serious physical disorders, including diabetes, cardiovascular disease, stroke, arthritis and certain types of cancers. Despite such extensive medical needs, adults with serious mental illnesses often do not receive treatment for their chronic medical conditions. About 34% of MHMRA patients do not report having a PCP upon admission to mental health and it is unknown how many who reported

having a PCP actually maintain regular appointments for their chronic health care problems. Because of the high rates of medically indigent within MHMRA and Houston, we can assume few patients maintain regular follow-up. By improving mental health and medical treatment access for MHMRA patients via a collaborative treatment model, chronic conditions can be treated before the need for emergency treatment is required.

The concept of a medical home that can address these needs is key to improving both access to care and continuity of care which, in turn, produces improved outcomes for patients. When coupled with protocols, training, technology and team delivery models, co-location has the potential to improve communications between providers and enhance coordination of care. Coordination of care has been shown to provide improved medical care at significantly lower costs. Additionally, access to care is enhanced because individuals do not have to incur the cost or burden of arranging transportation. By being able to address both physical and behavioral health needs at one facility reduces rates of disengagement and failure to follow through; this is because customers will be relieved of having to plan and co-ordinate transportation to multiple locations for different services.

To summarize, the rationale for the proposed program includes: 1) improved patient physical and mental health care, 2) reduced costs due to improved, collaborative and proactive care coordination and preventative care, 3) increased consumer satisfaction due to ease of receiving services and 4) improved medical outcomes in a mental health population who are typically underserved.

Project Components:
In order to accomplish this integrated program the following core components will be addressed:
a) MHMRA will identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community.

- Both MHMRA clinics and FQHC locations will need to be identified and facility needs assessed

b) MHMRA will develop provider agreements to allow for co-scheduling and information sharing between physical health and behavioral health providers.
c) MHMRA will establish protocols and processes for communication, data-sharing, and referral between behavioral and physical health providers.
d) MHMRA will recruit physical health providers to provide services in the designated locations.
e) MHMRA will train physical and behavioral health providers in protocols, effective communication and team approach. A shared culture of treatment will be fostered by MHMRA and will include specific protocols and methods of information sharing, specifically as follows:

- Regular consultative meetings between physical health and behavioral health practitioners;
- Case conferences on an individualized as-needed basis to discuss individuals served by both types of practitioners; and/or
- Shared treatment plans co-developed by both physical health and behavioral health practitioners.

(MHMRA will provide home visitation as needed for assigned clinic patients to support care coordination and improve physical health and behavioral health outcomes.
f) MHMRA will acquire data reporting, communication and collection tools (equipment) to be used in the integrated setting, which may include an integrated Electronic health record system or participation in a health information exchange.

g) MHMRA will explore the need for and develop any necessary legal agreements that may be needed in a collaborative practice.
h) MHMRA will arrange for utilities and building services for these settings as is appropriate
i) MHMRA will develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual treated in these integrated service settings.
j) MHMRA will conduct quality improvement for project using methods such as rapid cycle improvement.
Through these core components, MHMRA hopes to address the mental and physical health needs of our patients who are at high risk for metabolic syndromes related to chronic medical conditions and poor health practices, both of which can be exacerbated by the use of psychotropic medications. In addition, because MHMRA serves an economically disadvantaged population, many patients often go without medical care.

Unique Community Need Identification numbers:

In addition, the proposed project addresses community needs:

- CN3-Inadequate access to Behavioral Health
- CN6- Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children and elderly
- CN9- High rates of preventable hospital readmissions
- CN10- High rates of preventable hospital admissions

The proposed program will meet several community needs by providing additional access to behavioral and physical health professionals. Furthermore, this service should help the community need to reduce reliance on ER services by engaging in more preventative care strategies.

Related Category 3 Outcome Measure(s):

IT-6.1 Percent improvement over baseline of patient satisfaction scores

Reasons/rationale for selecting the outcome measures:

Integration of primary and behavioral health care will provide the best opportunity to address the mental and physical health needs of our patients. Through collaboration and coordination of both behavioral and primary medical care we aim to significantly impact patient satisfaction within the targeted population.

Relationship to other Projects:

Currently, this is the only program proposed by MHMRA that addresses collaborative care between physical and mental health providers. Additional programs may be proposed by the RHP. The cohabitation of primary care and behavioral health is an important focus of our region in order to treat the patient base with comprehensive physical and behavioral healthcare issues. There are multiple initiatives in our RHP plan which addresses this need and all can be found on the Region 3 Initiative Grid in the addendums. The outcome measures focused to screening measures and access of the patient base.

Plan for Learning Collaborative:

In addition to participation in RHP collaborative programs we have included in the metrics and milestones, we will encourage collaboration between treatment providers in bi-weekly meetings.

Project Valuation:

In the effort to value the proposed project accurately, assistance was sought from H. Shelton Brown, Ph.D. of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research. Their consultation was limited to only the valuation section of this document.

The following valuation is aligned with the demonstration program goals. These goals are to develop programs that enhance access to health care, increase the quality of care, provide the cost-effectiveness of care, and serve the health of the patients and families. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program, while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard. The number of life-years added is based on a review of the scientific literature.

Cost-Utility Analyses: A review of the scientific literature identified several QALY-based estimates of the cost utility of providing collaborative mental health care in medical settings. One study examined collaborative care intervention for multi-symptom patients including depression, diabetes and coronary heart disease (Katon, Russo, Lin, Schmittdiel, Ciechanowski, Ludman & Von Korff, 2012). According to the authors, there was a 0.335 QALYs gained.

A second study focused on treatment of major depression in the primary practice setting; they found a QALY gain of 0.049 (Rost, Pyne, Dickinson & LoSasso, 2005). In addition, Pyne, Smith, Fortney, Zhang, Williams, & Rost (2003) reported the cost utility of collaborative care for major depression. Their estimates yielded a 0.123 QALY gained over treatment as usual for females and an estimate of a slight, non-significant loss for males (-0.073 QALY).

An average increment across the three reports can be calculated as (0.335, 0.049, 0.123, and -0.073), which produces 0.1085 QALYs gained. Assuming the program would serve 100 persons in a year, the following formula shows the total valuation:

100	(persons served)
0.1085	(QALY gained)
× $50,000	(life year value)
= $542,500	**QALY Value**

Cost-effectiveness and Cost Savings: Cost-effectiveness analysis (CEA) is similar to CUA, except that the cost averted is compared to a common health outcome, such as cost per depression-free day. We identified three such studies. The first two studies assessed cost savings attributed to "depression free days." Rost and colleagues (2005) reported that a collaborative intervention for major depression produced a significant increment in days free of depression, resulting in 13.4 days between the first and second years of their study; whereas, Simon and colleagues (2012) reported a value of 47.7 depression-free days. Rost and colleagues also reported cost savings attributed to decreased medical costs. According to their findings, the intervention produced a savings of $777.20 (2012 dollars) per treated person. Assuming 100 people are served:

100	(persons served)
x $777.20	(health plan cost savings)
= $77,720	**Cost Savings: Health Costs**

Similarly, Dewa et al. (2009) found that collaborative care saved $545 (2012 US Dollars) per patient in disability benefits. Additional value can be calculated as:

100	(persons served)
x $545	(disability benefit savings)
= $54,500	**Cost Savings: Disability**

Summary and Total Valuation: This valuation analysis shows that the intervention will have a positive value for participants who receive the intervention(s). The total valuation is $**542,500 per 100 patients served per year.** Additional value in the form of depression-free days and reductions in disability payments are documented but not claimed.

Project Option 2.13 PROVIDE AN INTERVENTION FOR A TARGETED BEHAVIORAL HEALTH POPULATION TO PREVENT UNNECESSARY USE OF SERVICES IN A SPECIFIED SETTING: INTEGRATING SUBSTANCE ABUSE TREATMENT SERVICES INTO MENTAL HEALTH SERVICES

Unique RHP Project ID: 113180703.2.2/Pass 3

Performing Provider Name/TPI: MHMRA of Harris County / 113180703

Project Summary:

Provider**:** The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received any agency service in FY12, 36.5% were medically indigent and 51.9% had Medicaid. Of those who received mental health services in FY12, such as those being proposed in this project, 55% were medically indigent and 34.9% had Medicaid.

Intervention(s): Substance abuse treatment services will be integrated and embedded into existing MHMRA mental health treatment services (psychosocial rehabilitation).

Need for the project: Presently, 31% of all MHMRA consumers have a documented substance abuse disorder, and the suspected number of individuals coping with substance abuse is much higher. National rates of comorbidity indicate that more than four million adults meet the criteria for both serious mental illness (SMI) and substance dependence and abuse (Office of Applied Studies, 2003b). According to the National Survey on Drug Use and Health (NSDUH) 23.2% of individuals with SMI were dependent or abused illicit drugs and alcohol compared to 8.2% of individuals without SMI.

Target population: MHMRA consumers with a co-morbid substance abuse diagnosis. It is anticipated the program will provide service for about 900 patients.

Category 1 or 2 expected patient benefits: MHMRA will:

- decrease county jail bookings by 10% from baseline by DY5(I-1.1)
- decrease PES/HCPC admissions by 10% from baseline by DY5 (I-X.1)

Category 3 outcomes: MHMRA expects to increase one domain of patient satisfaction (TBD) by 10% from baseline by DY5.

2.13.1 Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting: Integrating substance abuse treatment services into mental health services

RHP Project Number: 113180703.2.2
Performing Provider/TPI: Mental Health and Mental Retardation Authority of Harris County/ 113180703

Project Description:
This Mental Health and Mental Retardation Authority (MHMRA) project will improve behavioral health care and reduce unnecessary use of emergency care by integrating substance abuse treatment services with existing mental health treatment services.

The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those who received mental health services in FY12, such as those being proposed in this project, 55% were medically indigent and 34.9% had Medicaid. The purpose of this project is to improve behavioral health and reduce unnecessary use of emergency psychiatric services by integrating substance abuse treatment services with existing mental health treatment services (psychosocial rehabilitation). The program will consist of assessment, individual therapy, group therapy, and will be embedded into existing treatment teams, consisting of licensed counselors, case workers, psychiatrists and psychologists.

Goals and Relationship to Regional Goals:
Program goals include reduction in psychiatric emergency services, reduction in jail bookings, reduction and/or cessation of drug and alcohol use, increased outpatient treatment participation, and increased mental health functioning. Additionally, consumer satisfaction will be assessed. These goals are compatible with the selected core components and the milestone and metrics addendum.
Regional goals:
It is important to note this project directly meets four broad goals identified by the region. First, it improves on existing programs and infrastructure by adding a component of treatment to existing community mental health clinics. Second, it increases access to specialty care services by providing empirically based substance abuse treatment to individuals who otherwise, may not be able to afford this type of intervention. Next, the recovery model of substance abuse is inherently a patient-centered approach that moves away from the historical "disease" focused model of substance dependence. The proposed program will also complement the regional goal to develop a culture of "best practices" whereby the patient/consumer plays a more active role as a stakeholder by completing consumer satisfaction surveys. Finally, this program would provide empirically validated substance abuse treatment using national standards.

Challenges:

Patients with co-morbid disorders may be more reticent to engage in treatment and may have a higher early-termination rate than non-dually diagnosed consumers; MHMRA will utilize empirically based treatments, such as motivational interviewing to combat these challenges. In order to ameliorate any difficulties related to hiring staff, MHMRA plans to contract with the Houston Council on Alcohol and Drugs to provide this service inside the MHMRA Clinics.

5 year expected outcome:
The expected five-year outcome is to have a fully functioning, integrated substance abuse treatment program embedded in outpatient mental health services.

Starting Point/Baseline:
Although MHMRA offers substance abuse treatment within the context of assertive community treatment, outpatient substance abuse treatment is virtually non-existent in other treatment programs. In order to accomplish this project, MHMRA plans to contract to hire 30 licensed clinical dependency counselors (LCDCs) to provide outpatient substance abuse treatment among existing MHMRA mental health clinics.

Rationale:
MHMRA of Harris County is an ideal agency to host this intervention given the rate of co-morbid drug and alcohol use among the severely mentally ill. Presently, 31% of all MHMRA consumers have a documented substance abuse disorder, and the suspected number of individuals coping with substance abuse is much higher. National rates of comorbidity indicate that more than four million adults meet the criteria for both serious mental illness (SMI) and substance dependence and abuse (Office of Applied Studies, 2003b). According to the National Survey on Drug Use and Health (NSDUH) 23.2% of individuals with SMI were dependent or abused illicit drugs and alcohol compared to 8.2% of individuals without SMI.

Not only is there a high base rate of co-occurring disorders in outpatient treatment, but the outpatient population accesses acute services at a higher rate. The Texas Health and Human Services Commission conducted a study in 2010 that examined inpatient admissions, mental health and substance abuse; results revealed that of those hospitalized for a mental health or substance abuse issue, 24% have a potentially preventable admission. Furthermore, this study noted the increased rates of potentially preventable admission for any patient initially hospitalized for any issue if they have a co-morbid mental health or substance abuse diagnosis.

Integration of treatment may provide an opportunity to identify more consumers who cope with substance abuse and mental illness and offer appropriate treatment. Additionally, it is hoped that integration will promote better outcomes and sustainable recovery among program participants. It is also expected that with preventative care, readmission rates to inpatient and psychiatric emergency services will be reduced.

Project Components:
In order to develop the proposed program the following core components (2.13) will be utilized:

a) Assess size, characteristics and needs of target population(s)
    - Completed. MHMRA currently completes the Adult Texas Recommended Assessment (TRAG) to establish a treatment plan for each consumer. Section Seven of the TRAG addresses co-occurring substance abuse and clinicians are required to rate consumer on this index using a Likert scale (1-5; 5 is synonymous

with drug dependence. This data is available in the current electronic medical record and charts
  - Secondly, MHMRA clinicians and psychiatrists assess substance abuse disorders as part of their intake assessment. If a consumer meets criteria for drug abuse or dependence, they render an appropriate diagnosis.

b) Review literature / experience with populations similar to target population.
  - To be completed. MHMRA will look to expert authorities within the agency and national resources, such as SAMHSA an NIDA prior to implementing specific treatment approaches or adopting specific manuals/materials.

c) Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.
  - To be completed. MHMRA will develop a program evaluation that includes qualitative and quantitative metrics (e.g., pre/post assessment of program participants, use of psychiatric emergency services, jail bookings, patient satisfaction surveys, etc.)

d) Design models which include an appropriate range of community-based services and residential supports.
  - To be completed. MHMRA currently offers residential treatment for individuals with co-morbid disorders. If this project is expanded, the agency will have community-based treatment as well. In addition, MHMRA will develop a toolkit that is interdisciplinary (mental health and substance abuse) and addresses key areas that impact the success of consumers. For example, consumers often need assistance with transportation, housing, and medical needs. MHMRA case workers and clinicians can address these needs using existing psycho-educational material.

e) Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.
  - To be completed. MHMRA will work with the outcomes department to identify pre/post measures and patient satisfaction surveys that are empirically validated for individuals who are diagnosed with co-morbid conditions. See Category 3 Outcome for more details.

f) Community-based interventions should be comprehensive and multispecialty.
  - As mentioned above, this program will integrate substance abuse treatment services with existing mental health treatment services (psychosocial rehabilitation). Additionally, consumers will have access to nursing services and medication management.

Milestones and Metrics:
The program goals are consistent with the regional goals and community needs discussed above. Furthermore, the improvement metrics chosen to evaluate the performance of the program were specifically chosen to determine the impact the program will have on the community: (I-1, I-1.1 - % decrease in preventable admissions and readmissions into county jail bookings and I-X, I-X.1 - % decrease from baseline in PES/HCPC).

Unique community need identification number the project addresses:

In addition to the regional goal, the following community needs are addressed with the proposed program:

- CN3-Inadequate access to Behavioral Health
- CN6- Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children and elderly
- CN9- High rates of preventable hospital readmissions

Related Category 3 Outcome Measure(s):
IT- 6.1 Percent improvement over baseline of patient satisfaction scores
Through integrating substance abuse treatment services into mental health services we will increase enrollment and serve more individuals with co-morbid mental illness and substance abuse disorders. The transformed system is proposed to be a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes.

Relationship to other Projects:
This program would enhance other MHMRA DSRIP proposals, such as expansion of outpatient behavioral services.

The behavioral health crisis in Region 3 is considerable and the proposed initiatives in our RHP plan will only imply a small impression into the overall community need for treatment, but is a good start. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is similar to many others in the sense of the category of behavioral health. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Plan for Learning Collaborative:
The project has no plans to establish a Learning Collaborative at this time but is open to doing so if another similar project is approved. Historically, MHMRA has worked informally and contractually with other providers in the community who are experts in substance abuse treatment, such as the Council on Drugs and Alcohol— Houston.

Project Valuation:
In the effort to value the proposed project accurately, assistance was sought from H. Shelton Brown, Ph.D. of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research. Their consultation was limited to only the valuation section of this document. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential, future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This

valuation uses quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per quality-adjusted life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this threshold. The number of life-years added is based on a review of the scientific literature.

Cost-Utility Analysis: One highly applicable cost utility study was identified that assessed the implementation motivational enhancement for substance abuse cessation. In 2001, Sellman, Sullivan, Dore, Adamson and MacEwan reported a randomized control trial for Motivational Enhancement Therapy (MET) for mild to moderate alcohol dependence. The study revealed that those who completed MET treatment (with mild to moderate dependence) showed a 0.116 QALY gain. These findings are relevant because MHMRA employees are trained in motivational interviewing techniques.

100	(persons served)
0.116	(QALY gained)
× $50,000	(life year value)
= $580,000	QALY Value

Cost Effectiveness and Cost Savings: Cost-effectiveness analysis (CEA) is similar to CUA, except that the cost averted is compared to a common health outcome, such as cost per depression-free day. We identified one benefit-cost study that is related. As mentioned previously, Mangrum and colleagues investigated the utility of integrated versus parallel treatment of co-occurring psychiatric and substance use disorders in Houston (2006). They reported an 8.9 percentage point decrease in the incidence of hospitalization for the integrated care treatment group. The parallel treatment group had a non-significant change in hospitalization. The cost savings per 100 persons treated associated with the avoidance of hospitalizations can be calculated as follows:

100	(persons treated)
0.089	(hospitalizations avoided)
10.25	(local average length of stay)
x $700	(local cost per public psychiatric hospital bed day)
$63,857.50	Total Hospital Costs Avoided

These authors also reported a parallel reduction of 4.1% in jail events for their integrated treatment group. This group would have averted cots at the following rate:

100	(persons treated)
0.041	(bookings avoided)
40.5	(local average length of stay)
x $130	(local cost per county jail bed day with mental health treatment)
$21,586.50	Total Jail Costs Avoided

Summary and Total Valuation: This valuation shows the proposed program will have a positive value for participants who receive the intervention(s). The combined QALY-based valuation ($580,000) plus psychiatric hospital cost avoidance ($63,857) plus jail cost avoidance ($21,586.50) valuation equals $685,444 per 100 treated persons served per year. Although further savings have been documented, **only the QALY-based estimate of $580,000 per 100 treated person s is claimed**. This concludes the valuation for the proposed project. The cited references for this section are included in the attached addendum.

Project Option 2.17 ESTABLISH IMPROVEMENTS IN CARE TRANSITION FROM THE INPATIENT SETTING FOR INDIVIDUALS WITH MENTAL HEALTH DISORDERS: REDESIGN OF THE TRANSITION FROM HCPC HOSPITALIZATION TO MHMRA OUTPATIENT AFTERCARE

Unique RHP Project ID: 113180703.2.3/Pass 3

Performing Provider Name/TPI: MHMRA of Harris County / 113180703

Project Summary:

Provider**:** The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received any agency service in FY12, 36.5% were medically indigent and 51.9% had Medicaid. Of those who received psychiatric emergency services in FY12, such as those being proposed in this project, 59.3% were medically indigent and 28.7% had Medicaid.

Intervention(s): The HCPC transition program will hire licensed mental health professionals to engage patients pre-discharge from HCPC and assist with successfully linking them to community mental health treatment.

Need for the project: Only 49% of individuals discharged from HCPC attend an outpatient appointment within 30 days. Additionally, data analysis indicates that 5% of patients who are discharged from HCPC account for a significant proportion of readmissions to ER services.

Target population: Individuals being discharged from state psychiatric hospitals and the local, public psychiatric facility, Harris County Psychiatric Center (HCPC). It is anticipated the program will provide service for about 1375 patients.

Category 1 or 2 expected patient benefits: MHMRA will

- Demonstrate a 10% increase from baseline in warm handoffs by DY5
- Demonstrate a 5% increase in outpatient follow-up after HCPC discharge within 7 and 30 days from baseline.

Category 3 outcomes: MHMRA expects to increase one domain of patient satisfaction (TBD) by 10% from baseline by DY5.

Project Option 2.17.1 Establish improvements in care transition from the inpatient setting for individuals with mental health disorders: redesign of the transition from HCPC hospitalization to MHMRA outpatient aftercare

Unique RHP Project Identification Number: 113180703.2.3
Performing Provider Name/TPI: Mental Health and Mental Retardation Authority of Harris County/113180703

Project Description:
The Mental Health and Mental Retardation Authority (MHMRA) of Harris County proposes to establish improvements in care transition from the inpatient setting for individuals with mental health disorders by redesigning the transition from HCPC hospitalization to MHMRA outpatient aftercare.

The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those who received mental health services in FY12, such as those being proposed in this project, 55% were medically indigent and 34.9% had Medicaid. MHMRA is also responsible for providing outpatient aftercare services to individuals being discharged from state psychiatric hospitals and the local, public psychiatric facility, Harris County Psychiatric Center (HCPC), within 10 days of discharge. The objective of this new program is to improve the transition from HCPC to MHMRA community mental health outpatient treatment settings (2.17).

Goals and Relationship to Regional Goals:
The proposed program seeks to improve outpatient treatment adherence while decreasing subsequent readmission rates at HCPC. In order to decrease HCPC readmission, the program will assess the factors that are associated with low utilization of outpatient treatment after hospitalization and employ empirically based practices to increase utilization. For example, the program will employ "warm handoffs" or improved communication among treatment professionals across different treatment settings. Additional interventions will be assessed and prioritized following a literature review of empirically based approaches. Another emphasis of the program will be on improving patients' involvement in discharge planning and outpatient treatment planning, using a person-centered approach. It is hoped that patients will be more likely to adhere to treatment plans if they are provided with more choices and autonomy in the treatment planning stage.

Challenges:
This project will examine barriers faced by individuals as they are discharged from HCPC inpatient care and referred to MHMRA for outpatient services. Influences of personal resources, attitudes about mental health and recovery, and the importance of ongoing care will be reviewed; strategies will then be designed to address each identified barrier, which may include motivational interviewing, providing transportation or other material resources, and addressing patient choice.

5-Year Expected Outcome for Provider and Patients:

Our ultimate goal (e.g., five year goal), is that nearly all patients will attend outpatient mental health treatment within 30 days of discharge from HCPC to include MHMRA outpatient community option.

In order to enhance the transition from inpatient to develop such a program, the following option and core components were chosen: 2.17.1, Design, implement, and evaluate interventions to improve care transitions from the inpatient setting for individuals with mental health disorders. These components have also been imbedded in the program process and improvement milestones (See milestone and metric chart for further details). The status of each component is noted, if that activity is currently underway:

a. Develop a team comprised of clinical and administrative representatives from acute care, ambulatory care, behavioral health and community-based non-medical supports
    - To be developed. The proposed program will consist of two additional mental health professionals (LPHAs) who interface with HCPC staff and existing MHMRA programs to facilitate improved transitions to community based mental health treatment.
b. Conduct an analysis of the key drivers of 30-day hospital readmissions for behavioral health conditions using a chart review tool
    - In progress. The MHMRA Outcomes Management Department is reviewing hospital re-admission data for predictors of rapid readmission.
c. Identify baseline mental health and substance abuse conditions at high risk for readmissions, (example include schizophrenia, bipolar disorder, major depressive disorder, chemical dependency).
    - In progress. The MHMRA Outcomes Management Department recently completed an analysis of psychiatric emergency service use among existing consumers.
d. Review best practices for improving care transitions from a range of evidence-based or evidence-informed models
    - To be completed. A literature review will be conducted to identify and assess evidence-based practices to improve transitions from inpatient to community treatment.
e. Identify and prioritize evidence-based strategies and clinical protocols that support seamless care transitions and reduce preventable 30-day readmissions.
    - To be completed. Following the literature review, administrators will review potential protocols and practices to improve transition.
f. Implement two or more pilot intervention(s) in care transitions targeting one or more patient care units or a defined patient population.
    - To be completed. Administration and management will select a pilot intervention and employ the strategy.
g. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Starting Point/Baseline:

Patients who are admitted to inpatient treatment at HCPC are given an appointment at MHMRA's outpatient clinics within 10- days of their discharge window. Patients are provided with an MHMRA appointment reminder form and the MHMRA crisis number should they need this prior to their MHMRA outpatient appointment. The patient also receives a reminder telephone call twenty-four (24) hours prior to the appointment and will receive follow up calls from the outpatient clinic if they fail to appear for services. Patients who are prescribed psychotropic medication are given five (5) days of medication with a prescription for a ten (10) day refill. It is well known that non-adherence to psychotropic medication is a key factor in relapse, and subsequently hospital readmission for individuals with severe mental illness.

Rationale:

Until recently, all new patients were required to visit MHMRA's Eligibility Center before obtaining an appointment at one of MHMRA's outpatient clinics. In June of 2011, MHMRA amended the intake procedures for patients who were hospitalized at HCPC. Although the Eligibility Center is centrally located, having to be screened at the Eligibility Center post-hospitalization was conceptualized as a barrier to access to care. Because of this theory, the intake procedure was changed; HCPC patients were given follow-up appointments while in the hospital, without having to go to the Eligibility Center first. This change was made to improve the rate of outpatient treatment among recently discharged patients from HCPC. The rate of increase went from approximately 47% to 65% during this period of time and is currently at around 59%; we do not have figures on the connectivity rate after attempts to reengage by outpatient staff as a result of a missed initial appointment. The National Quality Forum and HEDIS averages are 43 and 42% respectively for seven (7) day aftercare appointments; 60% after thirty (30) days. Additionally, data analysis indicates that 5% of patients who are discharged from HCPC account for a significant proportion of readmissions.

It is hypothesized that linkage to outpatient treatment will increase due to implementation of this program. This theory is consistent with research conducted by Boyer, McAlpine, Pottick, and Olfson (2000) using an inpatient psychiatric sample. They reported that three specific clinical interventions tripled the odds of successful linkage to outpatient care: communication about patients' discharge plans between inpatient staff and outpatient clinicians; patients' starting outpatient programs before discharge; and family involvement during the hospital stay.

Unique community need identification number the project addresses:

This project directly meets broad goals identified by the regional needs assessment. First, it improves on existing programs. Second, it increases access to specialty care services by providing a novel treatment approach to a pervasive problem. The program also offers a preventative, patient-centered approach that provides individualized care to prospective outpatient consumers. The proposed program will also complement the regional need to develop a culture of "best practices" whereby the patient/consumer plays a more active role in treatment planning, and also by completing patient satisfaction surveys.

Redesign of the transition from HCPC hospitalization to MHMRA outpatient aftercare will address the following community needs:

- CN3-Inadequate access to Behavioral Health
- CN6- Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children and elderly
- CN9- High rates of preventable hospital readmissions

Relationship to Other Projects:

At this time there is not enough information available from the RHP to describe how this project may or may not be related to other RHP DSRIP proposals. However, this project will interface with the expansion of the collaborative primary medical and behavioral health care and expansion of outpatient treatment teams.

The behavioral health crisis in Region 3 is considerable and the proposed initiatives in our RHP plan will only imply a small impression into the overall community need for treatment, but is a good start. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is similar to many others in the sense of the category of behavioral health. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Plan for Learning Collaborative:

MHMRA plans to participate in region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other performing providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's healthcare system.

Project Valuation:

In the effort to value the proposed project accurately, assistance was sought from H. Shelton Brown, Ph.D. of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research. Their consultation was limited to only the valuation section of this document. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential, future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially

different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention is a worthy value. The number of life-years added is based on a review of the scientific literature.

Cost-Utility Analysis: As mentioned above, QALYs represent relative improvements in quality of life years subsequent to a particular intervention. A thorough literature review revealed two studies that are relevant to the HCPC population. The first study, conducted by Chouinard and Albright (1997) provided a QALY gained of (0.125) when schizophrenic patients were treated with psychotropic medication (Risperdone) compared to those who received a placebo (-0.021). This study is relevant to the proposed population because individuals with schizophrenia represent a significant portion of MHMRA's priority population, and many of the individuals who are discharged from HCPC do not have ongoing psychiatric care, making them similar to a waitlist or placebo control group. Using the QALY of 0.125, we can estimate a QALY value per 100 people:

100	(persons served)
0.05	(percent of high utilizers)
0.125	(QALY gained)
$50,000	(life year value)
$31,250	**QALY Value per 100**

Cost Savings: A second way to value this proposal is to assess cost avoidance. Dixon et al. (2009) assessed the effectiveness of a brief intervention to improve continuity of psychiatric outpatient care for patients who were discharged from inpatient psychiatric hospitals. Compared to the control group, the intervention group had significantly fewer days between their hospital discharge and their first outpatient appointment (3.5 days versus 15.0 days, $p<0.001$); were more likely to schedule their outpatient follow up (78% versus 38%, $p<.001$); to have kept their outpatient appointment 180 days post discharge (100% versus 86%, $p<0.001$). The intervention group had fewer hospitalizations ($.2\pm.5$ versus $.6\pm1.0$, $\chi2=4.14$, $df=1$, $p=.042$) than the control group.

We can use the reduction of 40% between the control group and the intervention group to estimate cost savings relative to hospital admissions within the Houston area. Assuming the program serves 100 people, and 5% of the patients are at high risk of readmission as discussed in the program description, cost savings can be tallied. Using local data about HCPC costs and average length of stay among MHMRA consumers, the following cost savings is proposed:

100	(persons served)
0.05	(percent of high utilizers)
0.40	(reduced hospitalizations)
10.25	(average length of stay)
x $700	(average cost per diem)
$14,350	**Cost Savings**

Summary and Total Valuation: This valuation analysis shows that the intervention will have a positive value for participants. The combined estimates of $31,250 QALY gained and

$14,350 Cost Savings yield a total valuation of $45,600 per 100 people served per year. It is hoped the proposed program could benefit 1,375 people per year, for a valuation of $627,000 per 1,375 people served per year. This concludes the valuation for the proposed project. The cited references for this section are included in the attached addendum.

Project Option 2.13 PROVIDE AN INTERVENTION FOR A TARGETED BEHAVIORAL HEALTH POPULATION TO PREVENT UNNECESSARY USE OF SERVICES IN A SPECIFIED SETTING: EXPAND CHRONIC CONSUMER STABILIZATION INITIATIVE

Unique RHP Project ID: 113180703.2.4/Pass 3

Performing Provider Name/TPI: MHMRA of Harris County / 113180703

Project Summary: Provider**:** The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received any agency service in FY12, 36.5% were medically indigent and 51.9% had Medicaid. Of those who received psychiatric emergency services in FY12, such as those being proposed in this project, 59.3% were medically indigent and 28.7% had Medicaid.

Intervention(s): MHMRA plans to expand the Chronic Consumer Stabilization Initiative (CCSI), an interagency collaboration with the Houston Police Department (HPD). Staff members provide intensive case management and work directly with individuals, family members, health providers, and/or staff at living facilities. MHMRA provides family and community education about mental illness, outreach and engagement, intensive case management, Mental Health First Aide (an evidence-based mental health awareness program for community members), navigation to address physical health, housing and other social needs, crisis intervention and advocacy typically for several months, longer than other crisis diversion programs.

Need for the project: There are at least 70 more individuals that have been identified who meet the target population than can be served within the current capacity of the program.

Target population: The program will target individuals who have been diagnosed with a serious and persistent mental illness, have frequent admissions to emergency and crisis services, and have frequent encounters with HPD. It is anticipated that the program will provide services for about 60 patients.

Category 1 or 2 expected patient benefits: MHMRA will:

- Enroll 10 additional individuals yearly starting in DY 3 who chronically access PES services.
- Reduce emergency detention orders, law enforcement calls for service, arrests, and jail by 10% decrease from baseline by DY5
- Reduce PES/HCPC admissions by 10% decrease from baseline by DY5.

Category 3 outcomes: MHMRA expects to increase one domain of patient satisfaction (TBD) by 10% from baseline by DY5.

Project Option 2.13.1 Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting: expand chronic consumer stabilization initiative

Unique RHP Project Identification Number: 113180703.2.4
Performing Provider Name/TPI: Mental Health and Mental Retardation Authority of Harris County/113180703

Project Description:
The Mental Health and Mental Retardation Authority (MHMRA) of Harris County proposes to provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting by expanding a chronic consumer stabilization initiative.

The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those who received mental health services in FY12, such as those being proposed in this project, 55% were medically indigent and 34.9% had Medicaid. MHMRA seeks to expand the Chronic Consumer Stabilization Initiative (CCSI), an interagency collaboration with the Houston Police Department (HPD). The purpose of this project is to improve behavioral health and reduce unnecessary use of emergency psychiatric services by identifying individuals who are frequent users of psychiatric emergency services (PES) and police.

Goals and Relationship to Regional Goals:

The primary goal of the program is to identify, engage and provide services to individuals who have been diagnosed with a serious and persistent mental illness, have frequent admissions to emergency and crisis services, and have frequent encounters with HPD either through their own initiative or by family and/or collateral contact. Staff members provide intensive case management and work directly with individuals, family members, health providers, and/or staff at living facilities. Familial and community education about mental illness is a key component. CCSI provides outreach and engagement, intensive case management, Mental Health First Aide (an evidence-based mental health awareness program for community members), navigation to address physical health, housing and other social needs, crisis intervention and advocacy. It is also important to note the length of stay for individuals open to CCSI is several months, compared to other crisis diversion services in the area.

The goal of this project is to avert outcomes such as potentially avoidable inpatient admission and readmissions in settings including general acute and specialty (psychiatric) hospitals; to avert disruptive and deleterious events such as criminal justice system involvement; to promote wellness and adherence to medication and other treatments; and to promote recovery in the community. This can be done by providing community based interventions for individuals to prevent them from cycling through multiple systems, such as the criminal justice system; the general acute and specialty psychiatric inpatient system; and the mental health system. The five year goal of this project is to expand capacity in the program from 30 to 60 individuals and

reduce the number of law enforcement interactions, psychiatric crisis interventions, and psychiatric hospital admission for this cohort.

Challenges:

Challenges to implementation include motivating these individuals to accept and engage in care and to provide adequate education and information to family members and/or staff at their living facilities. These challenges will be addressed through intensive engagement activities, motivational interviewing, providing education, and collaborating with law enforcement to divert the participants away from intensive crisis services.

Starting Point/Baseline: CCSI is an existing MHMRA program that serves 30 individuals. The proposed project will expand the number of individuals served to 60.

Rationale:

There is a cohort of individuals within the region who have been identified by HPD as having multiple admissions to psychiatric emergency services involuntarily, brought in by law enforcement. MHMRA and Houston Police Department have collaborated in a project to provide specialized interventions for 30 of these individuals. However, at least 70 more individuals have been identified who meet the target population than can be served within the current capacity of the program.

Outcomes from the existing program reveal a significant reduction in criminal justice involvement, and psychiatric emergency care and hospitalizations. If this program averted only one PES service per patient per year, the savings would be more than $7,000 per patient ($700 per bed x 10.25 average length of stay in Harris County public psychiatric hospital). Because many of these individuals have multiple admissions per year, the savings would be considerably higher. For example, data from existing program revealed a 28% decrease in psychiatric emergency services and public psychiatric hospitalizations among existing CCSI consumers (MHMRA, 2010: Pilot Project Final Report). Additionally, all patients have a right to be served in the least restrictive environment possible. Lastly, the program has met with much success and has received recognition nationally, including nomination for Herman Goldstein Problem Oriented Policing award and an International Chiefs of Police Award.

Project Components:

a) Assess size, characteristics and needs of target population(s)
   - In progress. MHMRA and the Houston police department are continuously compiling a list of potential consumers who would benefit from the program. Demographic data, criminal justice involvement, and psychiatric emergency services are also gathered to better understand the needs of this population. MHMRA and HPD will continue to conduct this analysis as needed.

b) Review literature / experience with populations similar to target population.
   - To be completed. MHMRA will look to expert authorities and national resources, such as SAMHSA, prior to implementing specific treatment approaches or adopting specific manuals/materials.

c) Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.

- To be completed. MHMRA will develop a program evaluation that includes qualitative and quantitative metrics (e.g., pre/post assessment of program participants, use of psychiatric emergency services, jail bookings, patient satisfaction surveys, etc.)

d) Design models which include an appropriate range of community-based services and residential supports.
   - To be completed. MHMRA consumers often need assistance with transportation, housing, and medical needs. MHMRA clinicians can address these needs using existing psychoeducational material. Additionally, MHMRA has a residential step-down program that may be used by CCSI consumers if they need transitional housing post-hospitalization before returning to the community.

e) Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.
   - To be completed. MHMRA will work with the outcomes department to identify pre/post measures and patient satisfaction surveys that are empirically validated for individuals who are diagnosed with co-morbid conditions. See Category 3 Outcome for more details.

f) Community-based interventions should be comprehensive and multispecialty.
   - As mentioned above, this program is inherently multidisciplinary and uses resources provided both by the local mental health authority and the local police.

Milestones and Metrics:

The goals are consistent with the regional goals and community needs discussed above. Furthermore, the improvement metrics chosen for this project (I-10.1: % decrease in emergency detention orders, law enforcement calls for service, arrests, and jail, and I-X.1: % decrease from baseline in PES/HCPC) will determine the progress MHMRA is making to meet our stated goals. Both measure the success in reducing the use of jail services and ER services through the proposed program.

Relationship to other Projects: At this time there is not enough information available from the RHP to describe how this project may or may not be related to other RHP DSRIP proposals. However, the proposed project is similar to several MHMRA DSRIP proposals, including the expansion of the Crisis Residential Unit, and the Interim Care Clinic. All three proposals seek to expand psychiatric stabilization while reducing inpatient admissions and criminal justice involvement. It is hoped that many of the CCSI patients could access these less restrictive and more appropriate care levels in lieu of hospitalization, or civil commitment.

The behavioral health crisis in Region 3 is considerable and the proposed initiatives in our RHP plan will only imply a small impression into the overall community need for treatment, but is a good start. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is similar to many others in the sense of the category of behavioral health. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Unique community need identification number the project addresses:

This project directly meets broad goals identified by the regional needs assessment. First, it improves on existing programs and infrastructure by adding a component of treatment to existing community mental health service array. Second, it increases access to specialty care services by providing treatment to individuals who otherwise, may not be able to afford this type of intervention. Finally, this program is inherently a patient-centered approach that moves away from the historical "disease" focused model of repeated hospitalizations. The proposed program will also complement the regional need to develop a culture of "best practices" whereby the patient/consumer plays a more active role as a stakeholder by completing consumer satisfaction surveys.

CCSI addresses the following community needs:

- CN3-Inadequate access to Behavioral Health
- CN6- Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children and elderly
- CN9- High rates of preventable hospital readmissions

Plan for Learning Collaborative:

MHMRA plans to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

In the effort to value the proposed project accurately, assistance was sought from H. Shelton Brown, Ph.D. of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research. Their consultation was limited to only the valuation section of this document. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential, future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard. The

number of life-years added is based on a review of the scientific literature.

Cost-Utility Analysis: A literature reviewed one QALY that is highly relevant to this population. This 2012 study reported the QALY gains associated of assertive community treatment (ACT) compared to standard case management care in patients with schizophrenia (Karow, Reimer, König, Heider, Bock & Huber ...2012). ACT is highly similar to the proposed intervention in that it seeks to identify high utilizers of psychiatric emergency services and provide intensive case management to reduce psychiatric inpatient admissions and jail detentions. According to the Karow et al. study, the ACT intervention yielded a QALY of 0.76, whereas the treatment as usual group resulted in a QALY of 0.66; therefore, the incremental QALY for the ACT group was 0.10.

Applying this estimate to the current population the value of enhancing services for these underserved individuals from Level Four can be calculated as follows:

60	(persons served)
0.10	(QALY gained)
× $50,000	(life year value)
= $300,000	Level 4 QALY Value

Cost Savings: In addition to quality of life years adjusted, we obtained local data that supports the notion that ongoing treatment in the form of medication management and case management reduces hospital admissions. Specifically, individuals who are deemed "psychiatrically underserved" in Harris County require higher levels of public psychiatric hospital care. (Underserved means individuals received less services than their treatment plan and history indicates is necessary for recovery from mental illness.) In a sample of 6,275 consumers studied over seven years, underserved MHMRA consumers logged 0.819 additional hospital bed days per year. The increment in costs that could be averted with these interventions can be calculated as:

60	(persons served)
0.819	(psychiatric bed days gained)
× $700	(local bed day value)
= $ 34,398	Cost Savings

Summary and Total Valuation: This valuation analysis shows that the intervention will have a positive value for participants who receive the intervention(s).The expected value of this proposal is $334,398 ($300,000 and $34,398) per 60 people served per year. (If 100 people were served per year, the estimated savings would be $557,330). Additional cost savings in the form of diverted jail detentions is also expected.

Performing Provider Name/TPI: MHMRA of Harris County / 113180703

Project Summary:

Provider**:** The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received any agency service in FY12, 36.5% were medically indigent and 51.9% had Medicaid. Of those who received psychiatric emergency services in FY12, such as those being proposed in this project, 59.3% were medically indigent and 28.7% had Medicaid.

Intervention(s): MHMRA proposes to expand the current Mobile Crisis Outreach Team (MCOT), which provides mobile crisis outreach and follow-up to adults and children who are unable or unwilling to access traditional psychiatric services. When a consumer initiates an MCOT intervention, two trained MCOT staff responds to the consumers' needs, meeting them in a variety of settings including in the consumer's community, home, or school and provide assessment, intervention, education, and linkage to other services to address identified needs.

Need for the project: MCOT has grown by more than 52% since inception in 2004, from 1,224 episodes of care to 1,861 episodes in 2011. The program reached its current peak capacity in 2010 after its most recent expansion in 2008. Over the past twelve years, MHMRA's psychiatric emergency services have nearly doubled, logging an 88% increase in the volume of service episodes from 12,899 in 2000 to 24,365 in 2011.

Target population: Individuals in need of mental health services. It is anticipated that the program will provide services for about 720 patients.

Category 1 or 2 expected patient benefits: MHMRA will:

- Provide 720 more initial interventions from baseline by DY5
- Increase percent of MCOT patients who follow up at MHMRA outpatient clinic within 30 days of discharge from MCOT by 10% from baseline by DY5.
- Reduce PES/HCPC admissions by 10% from baseline by DY5.

Category 3 outcomes: MHMRA expects to increase one domain of patient satisfaction (TBD) by 10% from baseline by DY5.

Project Option 2.13.1 Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting: expansion of mobile crises unit

Unique RHP Project Identification Number: 113180703.2.5
Performing Provider Name/TPI: Mental Health and Mental Retardation Authority of Harris County/113180703

Project Description:
The Mental Health and Mental Retardation Authority (MHMRA) of Harris County proposes to provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting by expansion of a mobile crises unit.

The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those who received mental health services in FY12, such as those being proposed in this project, 55% were medically indigent and 34.9% had Medicaid.

MHMRA proposes to expand the current Mobile Crisis Outreach Team (MCOT), which provides mobile crisis outreach and follow-up to adults and children who are unable or unwilling to access traditional psychiatric services.

MCOT adopts a multidisciplinary approach to mental health treatment. When a consumer initiates an MCOT intervention, two trained MCOT staff respond to the consumers' needs. Teams may meet with the patient in a variety of settings including in the consumer's community, home, or school. MCOT provides assessment, intervention, education, and linkage to other services to address identified needs. For example, MCOT may facilitate a referral to a medical provider, nurse, outpatient psychiatric clinic, or inpatient psychiatric hospital. MCOT also provides nursing and medication management for consumers who are in need of this type of care. Additionally, the program may assist local medical emergency rooms that do not have a psychiatric presence by screening patients who may be in need of psychiatric emergency services.

MCOT provides case coordination services similar to MHMRA's Chronic Consumer Stabilization Initiative (CCSI); however, MCOT provides short-term (4-6 weeks) stabilization interventions to consumers in need, whereas the CCSI is a long-term program. MHMRA's Crisis Intervention Response Team (CIRT) is also a variation of mobile response, except that it provides only one initial crisis intervention by a team composed of a mental health professional and law enforcement officer and the CIRT team responds to police dispatch in an unmarked police car. CIRT interventions typically last several hours, compared to MCOT, which may last several weeks. It is also important to note that police officers are not part of the MCOT multidisciplinary team. There are times when a CIRT crisis response results in a referral to MCOT for follow-up and continued interventions.

Goals and Relationship to Regional Goals:

The primary goal of the program is to reduce preventable psychiatric hospital admissions among MCOT recipients. The second goal is to improve linkage to outpatient treatment. By

accomplishing these goals, cost savings will be accrued. Finally, we seek to provide high quality services as reflected by patient satisfaction surveys. Process goals have been identified to ensure the program is well designed and reflects best practices.

Challenges:

The challenges include identifying appropriate ongoing service providers for linkage. This challenge will be addressed through expansion of outpatient behavioral health services for individuals with severe psychiatric conditions.

Starting Point/Baseline:

The existing MCOT program provides clinical intervention to approximately 1400 unduplicated individuals per year. The proposed program will expand the number of cases from 1,400 to about 2,100 per year.

Rationale:

Mobile crisis services offer several advantages, including decreased psychiatric emergency services, decreased service costs, increased community treatment, increased patient autonomy, and decreased burden on the community to expand emergency services.

Mobile crisis services are well studied in the behavioral sciences literature. The most common outcome of mobile services is the reduction in preventable psychiatric hospitalizations. For example, Scott (2000) reported a 27% reduction in hospitalization rates, coupled with a 23% decrease in costs. Similarly, Hugo, Smout, and Bannister (2002) reported a 30% decrease in hospitalization rates when mobile crisis services were utilized. Our own program evaluation indicated MCOT interventions rarely result in inpatient admissions (e.g., less than 5% of service calls). The cost savings that result from preventable admissions is discussed below in the valuation section.

Mobile crisis services also seek to improve access to appropriate levels of treatment, such as linkage to community outpatient services. By engaging a consumer via mobile services, and successfully linking them to community treatment, our agency ensures the consumer is treated in the least restrictive environment possible. Again, MHMRA data indicates the longer a consumer is engaged in MCOT services (e.g., 3-4 weeks versus 1-2 weeks), the less likely the consumer is to return to the hospital immediately and the more likely the consumer is to access outpatient treatment.

Finally, Houston is a large city with a population of over 4.2 million. State and local data indicates an increased demand for mental health services. MHMRA data also supports this theory. For example, MCOT has grown by more than 52% since inception in 2004, from 1,224 episodes of care to 1,861 episodes in 2011. The program reached its current peak capacity in 2010 after its most recent expansion in 2008. Over the past twelve years, MHMRA's psychiatric emergency services have nearly doubled, logging an 88% increase in the volume of service episodes from 12,899 in 2000 to 24,365 in 2011. Further expansion is likely limited primarily by capacity.

Project Components:

In order to enhance the transition from inpatient to develop such a program, the following option and core components were chosen: 2.13.1, Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population. These components have also been imbedded in the program process and improvement milestones

(See milestone and metric chart for further details). The status of each component is noted, if that activity is currently underway:

a) Assess size, characteristics and needs of target population(s)
    - In progress. MHMRA is in the process of completing a needs assessment to determine the number of consumers who may benefit from this expansion and the treatment needs of these consumers.
b) Review literature / experience with populations similar to target population.
    - To be completed. MHMRA will look to expert authorities and national resources, such as SAMHSA, prior to implementing specific treatment approaches or adopting specific manuals/materials.
c) Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.
    - To be completed. MHMRA will develop a program evaluation that includes qualitative and quantitative metrics (e.g., pre/post assessment of program participants, use of psychiatric emergency services, jail bookings, patient satisfaction surveys, etc.)
d) Design models which include an appropriate range of community-based services and residential supports.
    - In progress. MHMRA consumers often need assistance with transportation, housing, and medical needs. MHMRA clinicians currently address these needs using existing psychoeducational material. Additionally, MHMRA has a residential program that may be used by consumers if they need transitional housing.
e) Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.
    - To be completed. MHMRA will work with the outcomes department to identify pre/post measures and patient satisfaction surveys that are empirically validated for individuals who are diagnosed with co-morbid conditions. See Category 3 Outcome for more details.
f) Community-based interventions should be comprehensive and multispecialty.
    - As mentioned above, this program is inherently multidisciplinary.

Unique community need identification number the project addresses:

This project directly meets broad goals identified by the regional needs assessment. First, it improves on existing programs and infrastructure by filling a void that is unmet by existing psychiatric outpatient clinics and psychiatric emergency services. Second, it increases access to specialty care services by providing mobile treatment. The program also offers a preventative, patient-centered approach that provides short-term mental health treatment to those in urgent need. The proposed program will also complement the regional need to develop a culture of "best practices" whereby the patient plays a more active role as a stakeholder by completing patient satisfaction surveys.

The MCOT Expansion will address the following community needs: CN2-Insuffcient Access to Behavioral Health; CN5- Integrated Care for Behavioral Health; CN12- Improved Access to Patient Education; and CN14-Reduction of ER Services.

Relationship to other Projects: At this time there is not enough information available from the RHP to describe how this project may or may not be related to other RHP DSRIP proposals. However, the proposed project complements several MHMRA DSRIP proposals, including the expansion of the Crisis Residential Unit and expansion of the Chronic Consumer Stabilization Initiative. All three proposals seek to expand psychiatric stabilization while reducing inpatient admissions.

Numerous community needs assessments reflect an extreme need for behavioral health services to include outpatient treatment centers, crisis stabilization units, inpatient beds, and much more. The lack of funding as well as complexity of the regions patient base has limited the amount of behavioral health treatments available to our region and continues to drive cost in emergent and inpatient situations. The Crisis Stabilization Unit has a direct correlation to all behavioral health programs recommended in the RHP plan and will be a focus of two of the largest Local Mental Health Authorities of our region. Both CSU's share the outcome measures of mental health admissions & readmissions, and improvement of patient satisfaction scores. The Region 3 Initiative Grid attached in the addendum reflects the direct relationships of this initiative.

The specific community needs that the proposed program addresses include:

- CN3-Inadequate access to Behavioral Health
- CN6- Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children and elderly
- CN9- High rates of preventable hospital readmissions

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

In the effort to value the proposed project accurately, assistance was sought from H. Shelton Brown, Ph.D. of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research. Their consultation was limited to only the valuation section of this document. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential, future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

The following valuation is aligned with the demonstration program goals to develop programs that enhance access to health care, increase the quality of care, the cost-effectiveness of care provided and the health of the patients and families served. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential, future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures

the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the intervention is cost effective. The number of life-years added is based on a review of the scientific literature.

Cost-Utility Analysis: After an exhaustive review of the literature, no studies were located that contained a QALY for mobile crisis services; therefore the valuation proposed is limited to cost savings studies.

Cost-Effectiveness and Cost Savings: Cost-effectiveness analysis (CEA) is similar to CUA, except that the cost averted is compared to a common health outcome, such as cost per depression-free day. We did identify a benefit-cost study that is related.

As previously discussed, Scott (2000) showed that people with mental illness using mobile crisis services avoided hospitalizations in 55% of the cases in Alabama compared those who received police intervention (28%) resulting in a net reduction of 27% in hospitalization. Additionally, MCOT services were 23% less costly per person ($2,295, 2012 US Dollars) compared to those served by the police department ($2,964). These costs include both program costs and hospitalization costs. Similar results were found in a study that compared mobile crisis assessment to emergency room assessment (Hugo, Smout & Bannister 2002). Their study showed that the 298 individuals receiving MCOT were 30% less likely to be admitted to a psychiatric inpatient unit compared to individuals served within an emergency room, regardless of their clinical characteristics.

The average reduction in hospitalization rate between these two studies is 28.5% (27+30/2). It is important to note the average cost of inpatient hospitalization in the Harris County Hospital District is $700 per day, with an average length of stay of 10.25 days (SD=7.23, N=33,680).

100	(People served)
.285	(Reduction in inpatient admissions, or 28.5%)
$700	(Average cost per hospital day)
x 10.25	(Average psychiatric hospital length of stay)
= $204,487.50	**Total Valuation**

Additional Costs: Hickey, Strang & Cantu (2012) reported that MHMRA of Harris County adult outpatient care reduced the annual percentage of individuals booked into the County Jail by 5% during an average 1.33 year treatment episode when compared to the rate in the year prior to admission to outpatient services. An average length of incarceration for mentally ill offenders in the County Jail is 40.73 days (Nguyen, Hickey & Farenthold, 2005). At a cost of $130/day for individuals receiving mental health care inside the jail, the cost savings can be estimated as (5% reduction x 40.73 days x $130/day x 100 served) $264,949 per 100 served.

Valuation: This valuation analysis shows that the intervention will have a positive value for participants who receive the intervention(s). All valuations used 100 individuals that would receive all components of the program. Assuming a reduction of 28.5% in hospitalization rates, an average length of stay of 10.25 days, and $700 per day, the total valuation is estimated at nearly $205,000 per 100 individuals served. With the addition of jail avoidance costs ($264,949) the **total valuation would be $469,949 per 100 served**. Since the project aims to serve 720 patients, the total valuation ($469,949 X 720/100) is $3,383,632.80.

Project Option 2.13 PROVIDE AN INTERVENTION FOR A TARGETED BEHAVIORAL HEALTH POPULATION TO PREVENT UNNECESSARY USE OF SERVICES IN A SPECIFIED SETTING: Transitional Residential Treatment Post-Incarceration

Unique RHP Project ID: 113180703.2.6/Pass 3

Performing Provider Name/TPI: MHMRA of Harris County / 113180703

Project Summary:

Provider**:** The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received any agency service in FY12, 36.5% were medically indigent and 51.9% had Medicaid. Of those who received psychiatric emergency services in FY12, such as those being proposed in this project, 59.3% were medically indigent and 28.7% had Medicaid.

Intervention(s): MHMRA proposes a 25-bed residential facility to provide supportive housing to individuals who are at risk for mental health crisis due to recent release from Harris County Jail. This program would provide transitional services for up to 60 days with the goal of linking clients with outpatient psychiatric treatment, medical services, and social security benefits or employment through the Department of Assistive and Rehabilitative Services (DARS). Peer supporters will offer counseling, peer led groups, assistance in resource identification, coping skills enhancement, substance abuse and mental health treatment and models of behavioral change.

Need for the project: Currently there are no programs that provide temporary housing for recent inmates while they are attempting to re-enter society. Such a program is needed due to the significant overlap between crime and mental health issues. Even individuals without a history of mental health issues may enter a crisis upon their release when there are no supports.

Target population: Individuals who are at risk for mental health crisis due to recent release from Harris County Jail. It is anticipated the program will provide service for about 200 patients.

Category 1 or 2 expected patient benefits: MHMRA will

- Enroll and serve 200 patients by DY5
- Reduce readmission rate to criminal justice system by 10% by DY 5 and
- Reduce readmission rate to psychiatric emergency services by 10% by DY 5

Category 3 outcomes: MHMRA expects to increase one domain of patient satisfaction (TBD) by 10% from baseline by DY5.

Project Option 2.13 Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting: transitional residential treatment post-Incarceration

Unique RHP Project Identification Number: 113180703.2.6
Performing Provider Name/TPI: Mental Health and Mental Retardation Authority of Harris County/113180703

Project Description:
The Mental Health and Mental Retardation Authority (MHMRA) of Harris County proposes to provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting: transitional residential treatment post-Incarceration.

The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those who received mental health services in FY12, such as those being proposed in this project, 55% were medically indigent and 34.9% had Medicaid.

MHMRA proposes a 25-bed residential facility to provide supportive housing to individuals who are at risk for mental health crisis due to recent release from Harris County Jail. These individuals are at heightened risk for destabilization subsequent to poor supports in the community. They often have difficulty accessing mental health treatment, medical interventions, and secure housing. This program would provide transitional services for up to 60 days with the goal of linking clients with outpatient psychiatric treatment, medical services, and social security benefits or employment through the Department of Assistive and Rehabilitative Services (DARS). Peer support is an essential element of the program; peers will co-lead 2 – 3 groups per day to enhance coping skills, identify resources and model behavioral changes that will improve efficacy in community interactions. Integrated interventions aimed at reducing substance abuse and symptoms of mental disorder will be offered for residents with these co-morbid conditions (estimated at 30-50% of the population).

Goals and Relationship to Regional Goals:
The five year goal is to establish a transitional housing program tailored to meet the needs formerly incarcerated individuals. The program seeks to serve 150 clients per year by providing cognitive behavioral therapy and psycho-education (e.g., symptom management, problem solving and coping skills, and after-care). The milestones we selected are to reduce unnecessary inpatient hospitalizations, reduce criminal recidivism, and provide transitional housing and community mental health treatment.

Challenges:
One of the biggest challenges is the stigma related to offering high quality services to former inmates. Although offenders have technically paid their debt to society (e.g., via incarceration), there are many barriers to obtaining adequate employment, support services and

education in order to regain a viable status within society. Because of frequent recidivism and public safety concerns, this population is an unpopular one to provide advocacy. We plan to address this challenge by meeting regularly with stakeholders and other performing partners and by providing education about the needs of this population and the societal benefits of addressing these needs.

Starting Point/Baseline:

Currently there are no supportive psychiatric housing programs for post-incarceration in the Houston area.

Rationale: Research indicates half of all prison and jail inmates have a mental health problem (James & Glaze, 2006). The percent of mental illness varies depending on the setting. For example, 56% of state prisoners, 45% of federal prisoners, and 64% of jail inmates are reported to have a diagnosed mental illness. The findings in this report were based on data from personal interviews with state and federal prisoners in 2004 and jail inmates in 2002. Whether an individual has a pre-existing mental illness or not, the psychosocial stress related to incarceration and re-entry without support are sufficient to lead to mental health crises.

In addition to mental health issues, this population commonly experiences other barriers to re-entry such as substance abuse, physical health problems, homelessness and employability. Between 20% and 38% of those with infectious diseases, such as HIV and tuberculosis, have been in the prison system and will need ongoing medical treatment upon release (Travis, Solomon & Waul, 2001).

According to Travis et al., (2001) prison health systems are significant providers of health and behavioral health services to a largely indigent population. Travis and colleagues also noted that individuals who are gainfully employed, and are paid adequately are less likely to commit future crimes and be incarcerated than those who are not employed. By providing supportive housing, mental health and substance abuse treatment, employment training and linkage to other needed services, those being released from jails and prisons may be able to reduce their recidivism and become more stable, productive members of society.

Project Components:

In order to develop the program described above, the following option and core components were chosen: 2.13.1, Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population. These components have also been imbedded in the program process and improvement milestones (See milestone and metric chart for further details).

A. MHMRA will assess size, characteristics and needs of the post-incarcerated population through collaborations with local agencies.
B. MHMRA will review literature / experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, forensic encounters, or incarceration, while improving quality of life.
C. Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.

D. Design models which include an appropriate range of community-based services and residential supports.
E. Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.

Unique community need identification number the project addresses:

This project directly meets broad goals identified by the regional needs assessment. First, it improves on existing programs and infrastructure by filling a void that is unmet by existing psychiatric outpatient clinics and psychiatric emergency services. Second, it increases access to specialty care services by providing these services to a disenfranchised population. The program also offers a preventative, patient-centered approach that provides short-term mental health treatment to those without other resources. By providing such services the community problem of increased demand on criminal justice system will be addressed. The proposed program will also complement the regional need to develop a culture of "best practices" whereby the patient plays a more active role as a stakeholder by completing patient satisfaction surveys.
The proposed program will address the following community needs:

- CN2-Insuffcient Access to Behavioral HealthCN3-Inadequate access to Behavioral Health
- CN6- Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children and elderly
- CN9- High rates of preventable hospital readmissions
- CN18- Insufficient access to integrated care programs for behavioral health and physical health conditions

Relationship to other Projects: The proposed project complements several MHMRA DSRIP proposals, including the expansion of the Crisis Residential Unit and expansion of the Chronic Consumer Stabilization Initiative. All three proposals seek to expand psychiatric stabilization while reducing inpatient admissions.

The behavioral health crisis in Region 3 is considerable and the proposed initiatives in our RHP plan will only imply a small impression into the overall community need for treatment, but is a good start. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is similar to many others in the sense of the category of behavioral health. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other performing providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's healthcare system.

Project Valuation:

In the effort to value the proposed project accurately, assistance was sought from H. Shelton Brown, Ph.D. of the UT Houston School of Public Health and Thomas Bohman, Ph.D.

of the UT Austin Center for Social Work Research. Their consultation was limited to only the valuation section of this document. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential, future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program, while the second is treatment as usual.

Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard. The number of life-years added is based on a review of the scientific literature.

Cost-Utility Analysis: Although no direct studies of this type were found, a study related to housing for persons living with HIV seemed relevant. A cost-utility analysis by Holtgrave and colleagues (2012) was based on data from the Housing and Health (H&H) study of rental assistance for homeless and unstably housed persons living with HIV in Baltimore, Chicago, and Los Angeles. They combined these outcome data with information on intervention costs to estimate the cost-per-QALY gained. They estimated that the cost-per-QALY-saved by the HIV-related housing services is $62,493. They also found that 0.0324 QALYs were gained due to improvements in perceived stress and thereby, quality of life.

For this valuation we focus on housing assistance. Assuming our 100 participants who each participate in crisis residential program, the total value gained from this component would be:

100	(persons served)
0.0324	(QALY gained)
× $50,000	(life year value)
= $162,000	**QALY Value**

Cost-effectiveness and Cost Savings: Cost-effectiveness analysis (CEA) is similar to CUA, except that the cost averted is compared to a common health outcome, such as cost per depression-free day. We identified several related cost-benefit studies.

Crisis Residential Treatment: Research indicates crisis residential units are more cost effective than inpatient hospitals; in 2002, Fenton and team found the mean cost of an acute

treatment episode was 44% lower per treatment in a residential crisis program as compared to treatment at a general hospital. They found an average savings of $17,504 (2012 US dollars) per acute care episode per year (treated in residential crisis program rather than a general hospital). Sledge and colleagues (1996) found similar results; they reported that when patients were randomly assigned to crisis respite care rather than hospitalization, respite care costs were $13,585 (2012 US dollars) lower per year. **The average cost savings between these two studies was $15,544.**

A study conducted by Adams and El-Mallakh (2009) investigated crisis stabilization services in Kentucky. The authors determined the cost for one day of care of crisis stabilization was $195 (in 2012 US dollars), while the cost for a day at the state hospital was $488 (in 2012 US dollars) – a savings of $293 per day. Although the Adams and El-Mallakh (2009) study is relevant, the study design did not randomize the patients; therefore it was not used to value this project.

Based on average savings of $15,544 per acute care episode per year (treated in residential crisis program rather than a general hospital):

100	(persons served)
× $15,544	(savings per acute care episode)
= $1,554,400	**Cost Savings**

Dual Disorder (Substance Abuse and Residential) Treatment: French, Salomé & Carney, et al. (2002b) estimated the costs and benefits of residential addiction treatment at five programs in the State of Washington that serve publicly funded clients. They reported an average (per client) total economic benefit was $58,868 (2012 US Dollars) over one year, leading to estimates of $45,314 for average net benefit and 4.34 for the benefit–cost ratio.

The benefits and costs associated with mutual-help community-based recovery homes were reported by Lo Sasso, Byro, Jason, Ferrari and Olson (2012). They noted that the intervention compared quite favorably to usual care: the net benefit was estimated to be between $9,450 and $15,370 (2012 US Dollars) per person per year on average, depending on the method employed.

In a study with a more comparable target sample, French and colleagues examined the effectiveness of a therapeutic community for homeless mentally ill chemically dependent consumers (French, McCollister, Sacks, McKendrick & De Leon, 2002a). Among this homeless, mentally ill sample the incremental economic benefit estimate was $163,708 (2012 US Dollars), net benefit was $132,148, and the benefit–cost ratio was 5.2.

Community residential treatment for those with dual (mental health and substance abuse) disorders has been observed to reduce subsequent heath care costs by half, a value or $13,288 per treated individual when compared to hospital care (Timko, Shuo, Sempel & Barnett, 2006).

An average across the four relevant studies yields an estimated annual savings per treated person of $33,341. Since the residential substance abuse treatment cannot clearly be identified as a unique contributor to positive outcome above and beyond the crisis residential treatment component, its value is offered as indication of probable additional benefit but this value will not be added to the overall valuation.

Additional Cost Savings: Buck, Brown & Hickey (2011) reported on a less intensive intervention with just-released mentally ill jail offenders in Harris County. Results indicate that those who were linked to services after their release had arrest rates that were 36% lower one year after contact with the program compared with the number of arrests one year before contact with the program. Also, the average number of days spent in jail decreased by 23, from 65 to 42 days during the year after contact with the program. Total annual criminal charges (misdemeanors and felonies) for each participant had also been reduced by 56% during the year after contact with the program.

Using the Buck et al., (2011) data and an estimated 23 day reduction in incarceration, we can calculate an estimated savings of $2,990 per treated individual, since the cost of a jail day for an individual with mental disorders is locally estimated at $130 (Harris County Office of Budget Management, personal communication). Summed across 100 patients the savings is $299,000.

Summary and Total Valuation: This valuation analysis shows that the intervention will have a positive value for participants who receive the intervention(s). The total expected value of benefits, based on the average of the Fenton article and the Sledge et al. article, is $1,554,400. The Fenton et al., (2002) study's QALY-based estimate was $162,000. Jail avoidance would contribute an additional $299,000. The total valuation is $2,015,400. In addition, other studies have shown this program will likely result in additional cost-savings. Since the program is projected to serve 200 patients, **the total value will be ($2,015,400 x 2 x 100) $4,030,800 per year.**

Project Option 2.13 PROVIDE AN INTERVENTION FOR A TARGETED BEHAVIORAL HEALTH POPULATION TO PREVENT UNNECESSARY USE OF SERVICES IN A SPECIFIED SETTING: CRISIS INTERVENTION RESPONSE TEAM (CIRT)

Unique RHP Project ID: 113180703.2.7/Pass 3

Performing Provider Name/TPI: MHMRA of Harris County / 113180703

Project Summary:

Provider: The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received any agency service in FY12, 36.5% were medically indigent and 51.9% had Medicaid. Of those who received psychiatric emergency services in FY12, such as those being proposed in this project, 59.3% were medically indigent and 28.7% had Medicaid.

Intervention(s): We propose an expansion of three additional teams of the Crisis Intervention Response Team (CIRT), which is a program that partners law enforcement officers who are certified in crisis intervention training with licensed master-level clinicians to respond to law enforcement calls. Together, these teams respond to calls involving with individuals in serious mental health crises. Additionally, the team responds to SWAT team calls and conducts follow-up investigations on individuals when indicated.

Need for the project: it is the only program that partners directly with law enforcement agencies. CIRT also plays a critical role in addressing unmet needs in a population with a high base rate of mental illness—those who interface with criminal justice agencies. It is also important to note that many of these individuals do not require detention and may be treated effectively in the community. Furthermore, detention may be traumatizing for the patient, making him/her less likely to interface with treatment professionals in the future. Thus, CIRT plays a vital role in de-escalating conflict, providing mental health assessment, and decreasing unnecessary arrests.

Target population: Individuals in crisis and require law enforcement intervention. It is anticipated the program will provide service for about 1005 patients.

Category 1 or 2 expected patient benefits: MHMRA will:

- Respond to 15% more CIRT calls than baseline by DY5.
- Increase the percent of CIRT cases that result in resolution on-site by % to be determined.

Category 3 outcomes: MHMRA expects to decrease mental health admissions and readmissions to criminal justice settings by 10% from baseline by DY5.

Project Option 2.13 Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting: crises intervention response team (CIRT)

Unique RHP Project Identification Number: 113180703.2.7
Performing Provider name/TPI: Mental Health and Mental Retardation Authority of Harris County/113180703

Project Description:
The Mental Health and Mental Retardation Authority (MHMRA) of Harris County proposes to provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting by expansion of a crises intervention response team.

The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those who received mental health services in FY12, such as those being proposed in this project, 55% were medically indigent and 34.9% had Medicaid. In an effort to provide needed services to the most critically ill population, MHMRA proposes to increase outpatient capacity by approximately 500 individuals potentially eliminating the current wait list for services in this geographic area. In order to address this issue we will choose to focus on project option 1.12.2: Expand the number of community based settings where behavioral health services may be delivered in underserved areas.

We propose an expansion of the Crisis Intervention Response Team (CIRT), which is a program that partners law enforcement officers who are certified in crisis intervention training with licensed master-level clinicians to respond to law enforcement calls. Together, these teams respond to calls involving with individuals in serious mental health crises. Additionally, the team responds to SWAT team calls and conducts follow-up investigations on individuals when indicated. While the team works collaboratively, the officer's role includes transportation and security, whereas the clinician's role is de-escalation, assessment, and resolution of the problem. The program operates in partnership with Houston Police Department and the Harris County Sheriff's Office. The proposed project seeks to expand this program by adding more CIRT teams to respond to crises.

Goals and Relationship to Regional Goals:
The goal of the program is to assist law enforcement officers in the de-escalation of crises and provide appropriate mental health treatment during a crisis. First, we expect an increase in the number of law enforcement calls that have a CIRT team response. Second, we plan to see a decrease in the number of hospital admissions for recipients of the CIRT intervention. Additionally, we hope the percent of CIRT calls that end with a peaceful resolution increase. Finally, in Category 3, we plan to see a decrease in arrests. It is also important to note process milestones have been selected which pertain to the development of this program, such as adding new CIRT teams and engaging in continuous quality improvement. The overall five year

outcome is to create a total of 3 new CIRT teams that accomplish these goals. Specific milestones and metrics are outlined in the Category 2 and 3 charts, which follow this narrative.

Challenges:

The challenges include identifying appropriate ongoing service providers for linkage. This challenge will be addressed through expansion of outpatient behavioral health services for individuals with severe psychiatric conditions.

Starting Point/Baseline:

MHMRA currently has a small CIRT unit which consists of thirteen teams. Specifically, this proposal seeks to add three more teams.

Rationale:

Law enforcement is often the front-line response to people experiencing mental health crises; however, until recently, law enforcement officers have had little to no mental health training (Hails & Borum, 2003). Recent studies that examined the impact of CIRT teams have found that partnerships between law enforcement and mental health system improve collaboration, efficiency, and the treatment of people with mental illness. Additionally, mobile services have been found to decrease inpatient hospital admissions. For example, Scott (2000) reported a 27% reduction in hospitalization rates, coupled with a 23% decrease in costs. Similarly, Hugo, Smout, and Bannister (2002) reported a 30% decrease in hospitalization rates when mobile crisis services were utilized.

While MHMRA has several crisis intervention programs, CIRT is unique. Specifically, it is the only program that partners directly with law enforcement agencies. CIRT also plays a critical role in addressing unmet needs in a population with a high base rate of mental illness—those who interface with criminal justice agencies. It is also important to note that many of these individuals do not require detention and may be treated effectively in the community. Furthermore, detention may be traumatizing for the patient, making him/her less likely to interface with treatment professionals in the future. Thus, CIRT plays a vital role in de-escalating conflict, providing mental health assessment, and decreasing unnecessary arrests. Finally, CIRT provides an educative role in policing and may improve the competency of law enforcement officers who respond to psychiatric emergencies.

Project Components:

In order to enhance the transition from inpatient to develop such a program, the following option and core components were chosen: 2.13.1, Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population. These components have also been imbedded in the program process and improvement milestones (See milestone and metric chart for further details). The status of each component is noted, if that activity is currently underway:

a) Assess size, characteristics and needs of target population(s)
    - MHMRA will continue to assess characteristics and needs of individuals involved in crisis calls involving law enforcement agents.

b) Review literature / experience with populations similar to target population.
    - MHMRA will continue to review literature and evaluate ongoing experiences with individuals in crisis to determine community-based interventions that are

effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and physical functional status, forensic encounters, death and in promoting correspondingly positive health and social outcomes / quality of life.

c) Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.
    - MHMRA's Outcome Management department will develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.

d) Design models which include an appropriate range of community-based services and residential supports.
    - MHMRA will continue to evaluate improvements on design models which include an appropriate range of community-based services and residential supports.

e) Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.
    - MHMRA will continue to assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.

f) Community-based interventions should be comprehensive and multispecialty.
    - As mentioned above, this program is inherently multidisciplinary.

Unique community needs identification number project addresses:

This project directly meets broad goals identified by the regional needs assessment. First, it improves on existing programs and infrastructure by filling a void that is unmet by existing psychiatric outpatient clinics and psychiatric emergency services. Second, it increases access to specialty care services by providing mobile treatment. The program also offers a patient-centered approach that provides short-term mental health treatment to those in urgent need. The proposed program will also complement the regional need to develop a culture of "best practices" whereby the patient receives collaborative treatment that is empirically supported by research.

The CIRT Expansion will address the following community needs:

- CN3-Inadequate access to Behavioral Health
- CN6- Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children and elderly
- CN9- High rates of preventable hospital readmissions
- CN10 High rates of preventable hospital admissions

<u>Relationship to other Projects:</u>

At this time there is not enough information available from the RHP to describe how this project may or may not be related to other RHP DSRIP proposals. However, the proposed project complements several MHMRA DSRIP proposals, including the expansion of the Crisis Residential Unit, Mobile Crisis Outreach Team, and Chronic Consumer Stabilization Initiative. All four proposals seek to expand psychiatric stabilization in the community while reducing inpatient admissions.

Numerous community needs assessments reflect an extreme need for behavioral health services to include outpatient treatment centers, crisis stabilization units, inpatient beds, and much more. The lack of funding as well as complexity of the regions patient base has limited the amount of behavioral health treatments available to our region and continues to drive cost in emergent and inpatient situations. The Crisis Stabilization Unit has a direct correlation to all behavioral health programs recommended in the RHP plan and will be a focus of two of the largest Local Mental Health Authorities of our region. Both CSU's share the outcome measures of mental health admissions & readmissions, and improvement of patient satisfaction scores. The Region 3 Initiative Grid attached in the addendum reflects the direct relationships of this initiative.

Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other performing providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

In the effort to value the proposed project accurately, assistance was sought from H. Shelton Brown, Ph.D. of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research. Their consultation was limited to only the valuation section of this document. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential, future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard. The number of life-years added is based on a review of the scientific literature.

Cost-Utility Analysis: After an exhaustive review of the literature, no studies were located that contained a QALY.

Cost-Effectiveness and Cost Savings: Cost-effectiveness analysis (CEA) is similar to CUA, except that the cost averted is compared to a common health outcome, such as cost per depression-free day. We did identify a benefit-cost study that is related.

Outcomes studies have documented the benefits of mobile crisis teams, both with law enforcement involvement, and absent police presence. Scott (2000) assessed a psychiatric mobile outreach service in Alabama and compared the intervention to police intervention *without* the presence of a mental health professional. In this study, the mobile outreach service successfully avoided hospitalization among 55% of patients, compared to routine law enforcement interventions (28%, $p<.01$), for an overall reduction of 27%. Additionally, the average cost of mobile services with a police officer were 23% less per person ($1,520, a value equivalent to $2,034 in 2012 (U.S. Department of Labor, 2012)) compared to those served by the police department ($1,963); these costs include both program costs and hospitalization costs.

In 2010, Kisely and colleagues sought to evaluate the impact of an integrated mobile team that paired a plain-clothed police officer with a mental health professional (Kisely, Campbell, Peddle, Hare, Pyche, Spicer & Moore, 2010). The researchers used a mixed-method which provided a controlled before-and-after comparison of the intervention area with a control area without access to such a service. Services were assessed for one year before and two years after program implementation. The intervention (CIRT) was highly utilized within the community, evidenced by an increase in recipients from 464 to 1666 per year. Although the number of participants increased, the time spent per service was less in the experimental condition, 136 minutes than in the control group (165 minutes; Student t test = 3.4, df = 1649, $P < 0.001$). This reduction in intervention time may translate into cost savings in the future as consumers were diverted into outpatient and preventative services rather than expensive psychiatric emergency services.

Using the combined estimate of cost savings from Scott (2000), one can estimate the value of mobile crisis services as follows:

100	patients served
x $2,034	per person inflation adjusted savings
= $203,400	Savings per 100 served

Summary and Total Valuation: This valuation analysis shows that the intervention will have a positive value for participants who receive the intervention(s). All valuations used 100 individuals that would receive all components of the program. The total valuation is estimated at $203,400 per 100 individuals served per year.

Mental Health and Mental Retardation Authority of Harris County

Pass 2

Project Option 2.13.1: Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population- IDD/ASD Wrap-Around and In-Home Services

RHP Project ID: 113180703.2.8 / Pass 2
Performing Provider / TPI: Mental Health and Mental Retardation Authority of Harris County / 113180703

Project Summary:
Provider: The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received any agency service in FY12, 36.5% were medically indigent and 51.9% had Medicaid. Of those who received IDD services in FY12, such as those being proposed in this project, 34.1% were medically indigent and 57.1% had Medicaid.

Intervention(s): The proposed program seeks to develop wrap-around and in-home services for high risk consumers with Intellectual and Developmental Disabilities and Autism Spectrum Disorders (IDD and ASD) and their families to avoid utilization of intensive, costlier services. More specifically, program staff will provide community based interventions for individuals to prevent them from cycling through multiple systems, by providing community-based, wrap-around services that help stabilize behavioral problems in the natural home, while linking the patient and family to other supports, such as a medical home, transition services to help individuals establish a stable living environment, peer support, employment, specialized therapies, respite, personal assistance, and linkage to short or long term residential options.

Need for the project: Harris County also has approximately 106,494 residents are with an intellectual and developmental disability; 24,000 with autism spectrum disorder; and of people in these groups, 38,700 are dually diagnosed with co-occurring mental illness. By providing timely intervention and linkage to community resources, individuals can be empowered to live independently or with their families, with minimal intrusion and maximum clinical benefit.

Target population: Harris County High risk consumers with Intellectual and Developmental Disabilities and Autism Spectrum Disorders (IDD and ASD) and their families. It is anticipated the program will provide service for about 200 patients.

Category 1 or 2 expected patient benefits:

- improvement in functional assessment (TBD) by 10% over baseline
- 10% decrease in admissions to State Supported Living Centers by DY 5

Category 3 outcomes: MHMRA expects to increase one domain of patient satisfaction (TBD) by 10% from baseline by DY5.

Project Option 2.13.1: Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population- IDD/ASD Wrap-Around and In-Home Services

RHP Project ID: 113180703.2.8 / Pass 2
Performing Provider / TPI: Mental Health and Mental Retardation Authority of Harris County / 113180703

Project Description:
The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves about 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received agency services in FY12, 60.0% were medically indigent and 32% had Medicaid. Of those who received IDD services, such as those being proposed in this project, 34.1% were medically indigent and 57.1% had Medicaid. With regard to incomes, 88% report family size and annual income placing them at or below 133% of 2012 Federal Poverty Level Guidelines. Only 5.2% of the agency's clientele report incomes above 100% of FPL. Harris County's ethnic diversity is reflected in the population served. Agency consumers self-describe the following ethnic backgrounds: African-Americans (34.5%), Anglos (27.1%), persons of Hispanic heritage (26.6%), Asian-Americans (2.8%) and those reporting other ethnicities (0.4%).

The proposed program seeks to develop wrap-around and in-home services for high risk consumers with Intellectual and Developmental Disabilities and Autism Spectrum Disorders (IDD and ASD) and their families to avoid utilization of intensive, costlier services. More specifically, program staff will provide community based interventions for individuals to prevent them from cycling through multiple systems, by providing community-based, wrap-around services that help stabilize behavioral problems in the natural home, while linking the patient and family to other supports, such as a medical home, transition services to help individuals establish a stable living environment, peer support, employment, specialized therapies, respite, personal assistance, and linkage to short or long term residential options.

Goals:
MHMRA will provide specialized services to children and adults with IDD/ASD and behavioral problems. These individuals often have multiple concomitant issues such as physical health conditions, family stressors resulting from the person's disability, homelessness, cognitive challenges, lack of daily living skills, and lack of natural supports. Texas' mental health system provides rehabilitative services and pharmacotherapy to people with certain severe psychiatric diagnoses and functional limitations, but the complex needs of people with IDD/ASD are beyond the resources of the mental health system and usually span across multiple systems of care.

This complex population often becomes frequent users of local public health systems, most notably emergency rooms and psychiatric inpatient units, ultimately at risk for institutional

placement in state supported living centers. The goal of this project is to avert outcomes such as potentially avoidable inpatient admission and readmissions in restrictive settings including state supported living centers and acute care psychiatric units; to avert disruptive and deleterious events such as criminal justice system involvement and institutionalization; to promote wellness and adherence to medication and other treatments; and to promote recovery in the community.

Regional Goals/Community Needs: This project directly meets broad goals identified by the regional needs assessment. First, it improves on existing programs and infrastructure by filling a void that is unmet by existing psychiatric outpatient clinics and psychiatric emergency services. Second, it increases access to specialty care services by providing treatment in an additional Houston location. The program also offers a preventative, patient-centered approach that provides brief psychiatric care to those in urgent need. The proposed program will also complement the regional need to develop a culture of "best practices" whereby the patient/consumer plays a more active role as a stakeholder by completing consumer satisfaction surveys.

The 5-year expected outcome(s): The hope is that by the end of the 5-year DSRIP project, the proposed program will have established an approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient and family needs, improves health care outcomes and patient satisfaction, facilitates access to primary and specialty care services for the underserved population of people with IDD/ASD, to ensure that they receive the most appropriate care for their condition, regardless of where they live or their ability to pay. The project is expected to transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction, empowerment and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system.

These goals are consistent with the regional goals and community needs discussed elsewhere. Furthermore, the improvement metrics chosen for this project (I-2.1: The percent decrease in preventable admissions and readmissions to state supported living centers and I-5.1:
The percentage of individuals receiving specialized interventions who demonstrate improved functional status on standardized instrument TBD) will determine the progress MHMRA is making to meet our stated goals.

Starting Point/Baseline:
Currently, MHMRA does not have a dedicated team as proposed.

Rationale:
Individuals with IDD or ASD exhibit deficits in adaptive behaviors as part of their diagnostic profile; however, when these deficits develop into behavioral excesses resulting from learned contingencies or, in approximately 33% of this population, from the existence of co-occurring mental illness in people with IDD/ASD has been widely recognized, timely intervention is required to avoid costlier levels of care. These behavioral excesses place extreme pressures on families who do not know where to find the few resources available to assist them in a time of need. Families may reach out for help and finding none, decide that out of home placement is the

only option. Such placements are expensive and burden the public system; moreover they are almost always avoidable.

In-home services are beneficial for people with IDD and ASD because behavior change can be effected in the setting where those behaviors are exhibited. This population is known for difficulties in generalizing treatment benefits; i.e., learning a skill in one setting and transferring it without additional training into another setting. In-home services, in contrast with clinic-based services, provide onsite skills training and reduce the need for generalization training. Additionally, individuals and families can experience success within their natural environment, thus reducing the temptation to seek alternative placements. Once behavioral stability is achieved, treatment benefits can be supported by linking the person and family to mainstream services such as specialized therapies, employment services, and other supports that allow increased independence and promote a sense of self-efficacy.

Treating the person with IDD/ASD only addresses part of the presenting problems. Families who have a loved one with a developmental delay and severe behavior problems often report elevated levels of stress, depression and marital discord. These families are further impacted by enforced unemployment when one parent must remain at home to manage the person with IDD/ASD, thus adding financial hardships to the family's stressors. Notably, family therapy is not supported in the array of services for people with IDD/ASD, yet is recognized as an important factor for promoting resilience and creating a strong foundation in which change for the better can occur.

The In-Home Team is designed to provide behavioral interventions, linkage to community options, and family supports to individuals with IDD/ASD who have serious behavior problems and are therefore at high risk of institutional referral, and who are not supported by the network of private Medicaid waiver providers. This intervention targets the decrease of problem behaviors, thus enabling individuals to remain in their homes and avoid more expensive and restrictive placements. Additionally, recognizing that the family must also be stable and healthy for the child to improve, family counseling and linkage and referral to community services is rolled into the service. This service is not included in the array of currently funded IDD services. Harris County also has approximately 106,494 residents are with an intellectual and developmental disability; 24,000 with autism spectrum disorder; and of people in these groups, 38,700 are dually diagnosed with co-occurring mental illness. By providing timely intervention and linkage to community resources, individuals can be empowered to live independently or with their families, with minimal intrusion and maximum clinical benefit.

Project Components:
In order to develop such a program, the following option and core components were chosen:
2.13.1 Expand the number of community based settings where behavioral health services may be delivered in underserved areas:

a. MHMRA will continue to assess the size, characteristics and needs of the target population through ongoing work with patients and families/caregivers.
b. MHMRA will continue to review literature and their experience with IDD/ASD populations to determine community-based interventions that are effective in averting negative outcomes such as repeated or extended inpatient psychiatric hospitalization, decreased mental and

physical functional status, nursing facility admission, forensic encounters and in promoting correspondingly positive health and social outcomes / quality of life.

c. MHMRA will utilize a team approach involving clinical and program staff and the newly formed Outcome Management Department and the Quality Management Department, to develop project evaluation plan using qualitative and quantitative metrics to determine outcomes.
d. MHMRA will design models which include an appropriate range of community-based services and residential supports.
e. MHMRA will assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.

Unique Community Need Identification numbers:
Enhancing the Intensity of Outpatient Behavioral Health Services will address the following community needs: CN3-Insuffcient Access to Behavioral Health; CN18- Integrated Care for Behavioral Health; CN20- Improved Access to Patient Education.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative: Currently, there is not a team dedicated to this service although one is needed due to the insufficient capacity to provide needed services. The proposed project is intended to close these gaps in the service continuum.

Related Category 3 Outcome Measure(s):
IT-6.1 Percent improvement over baseline of patient satisfaction scores
Reasons/rationale for selecting the outcome measure: Measurement of patient satisfaction is a key indicator of patient-centered care and has been targeted as a quality indicator by national organizations dedicated to improvement in patient outcomes, e.g. the National Council for Quality Assurance. Furthermore, if patients and their family are satisfied with services then we can assume they are being provided for adequately. On the other hand, if patients are dissatisfied having an avenue to express their concerns is important to empowering our clients.

Relationship to Other Projects: The proposed project has activities related to the following MHMRA proposals: 1.9 Expand Specialty Care Capacity: IDD Specialized Treatment and Rehabilitative Services (STARS) and 2.12 Implement/Expand Care Transitions Programs: IDD/ASD Inpatient Consultation and Liaison Service

Relationship to Other Projects in the RHP: The behavioral health crisis in Region 3 is considerable and the proposed initiatives in our RHP plan will only imply a small impression into the overall community need for treatment, but is a good start. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is similar to many others in the sense of the category of behavioral health. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our

participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

In the effort to value the proposed project accurately, assistance was sought from H. Shelton Brown, Ph.D. of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research. Their consultation was limited to only the valuation section of this document. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential, future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard. The number of life-years added is based on a review of the scientific literature.

Research has shown that care-givers of individuals with IDD/ASD are at risk for mental health problems of their own due to stress (Cummins, 2001). Past research has also linked aggression to parent distress (Chadwick, Beecham, Piroth, Bernard & Taylor, 2002; Douma, Dekker & Koot, 2006; Plant & Sanders, 2007; Weiss, Lunsky, Gracey, Canrinus & Morris, 2009). Parent training has been an effective tool to reduce stress related to caring for IDD/ASD individual, better ability to manage behaviors in the home and improved use of resources such as reduced ER visits (Hassiotis, Robotham, Canagasabey, Marston, Thomas & King, 2012). Through parent intervention, additional value can be gained. Using Ganz estimated indirect costs to family members caring for an individual with IDD/ASD at the average age of the patient (13 years old), the yearly costs were $9613.25.

100	(patients served)
x $9613.25	(annual indirect family costs)
= $961,325	**Cost Savings: Indirect Family**

Summary and Total Valuation: This valuation analysis shows that the intervention will have a positive value for participants. The combined value is $**961,325** per 100 people served.

Project Option 2.13.2: Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or a defined patient population- IDD/ASD Inpatient Consultation and Liaison Service

RHP Project ID: 113180703.2.9
Performing Provider / TPI: Mental Health and Mental Retardation Authority of Harris County / 113180703

Project Summary:
Provider**:** The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is a public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves more than 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received any agency service in FY12, 36.5% were medically indigent and 51.9% had Medicaid. Of those who received IDD services in FY12, such as those being proposed in this project, 34.1% were medically indigent and 57.1% had Medicaid.

Intervention(s): MHMRA proposes to expand and further develop the Inpatient Consultation and Liaison (C&L) team that provides consultation and services to patients suspected of Intellectual and Developmental Disabilities and Autism Spectrum Disorders (IDD and ASD) referred by attending physicians at the Harris County Psychiatric Center (HCPC); with subsequent expansion to provide similar services to other inpatient settings in Harris County.

Need for the project: Approximately 106,494 Harris county residents are diagnosed with an intellectual and developmental disability; 24,000 with autism spectrum disorder; and of people in these groups, 38,700 are dually diagnosed with co-occurring mental illness. When a person with a co-occurring condition requires hospitalization to stabilize symptoms of mental illness, they often encounter well-meaning clinicians who have limited exposure and experience in treating this population. This situation can be alleviated with specialized consultation by clinicians who are experts in ID/ASD and co-occurring mental illness. Not only would effective consultation include recommendations for inpatient treatment, but recommendations for effective discharge planning and care transition would be necessary to reduce preventable rehospitalizations.

Target population: Harris county residents with comorbid mental health and IDD/ASD issues presenting in psychiatric emergency services. It is anticipated that 225 individuals will be served by the program expansion.

Category 1 or 2 expected patient benefits: MHMRA will implement a protocol for inpatient consultation and care transition to be used on least 65% of identified patients by DY 5.

Category 3 outcomes: MHMRA expects to increase one domain of patient satisfaction (TBD) by 10% from baseline by DY5.

Project Option 2.13.2: Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or a defined patient population- IDD/ASD Inpatient Consultation and Liaison Service

RHP Project ID: 113180703.2.9 / Pass 2
Performing Provider / TPI: Mental Health and Mental Retardation Authority of Harris County / 113180703

Project Description:
The Mental Health and Mental Retardation Authority (MHMRA) of Harris County is public agency serving as the safety net provider for adults with serious mental illnesses, for children and adolescents with serious emotional disorders, for the developmentally delayed and for individuals experiencing acute psychiatric distress. MHMRA provides inpatient, residential and outpatient treatments, including psycho-therapy, case management and medication management for individuals. MHMRA serves about 49,000 Harris County residents out of a culturally and ethnically diverse population of over 4.1 million. Of those individuals who received agency services in FY12, 60.0% were medically indigent and 32% had Medicaid. Of those who received IDD services, such as those being proposed in this project, 34.1% were medically indigent and 57.1% had Medicaid.

MHMRA proposes to expand and further develop the Inpatient Consultation and Liaison (C&L) team that provides consultation and services to patients suspected of Intellectual and Developmental Disabilities and Autism Spectrum Disorders (IDD and ASD) referred by attending physicians at the Harris County Psychiatric Center (HCPC); with subsequent expansion to provide similar services to other inpatient settings in Harris County. This model is intended to divert people with IDD/ASD from higher cost, inpatient placement and into local resources. Accordingly, this project meets the Delivery System Incentive Reform Payment (DSRIP) Pool 1115(a) waiver component 2.12, Implement and expands care transitions programs.

Goals:
The goal of this project is to implement improvements in care transitions and coordination of care from inpatient to outpatient, post-acute care, and home care settings in order to prevent increased health care costs and hospital readmissions. By the end of year five, established protocols should result in a transformation of care that results in diversion of cases that do not need inpatient treatment, improved patient-specific inpatient protocols, and effective discharge and aftercare that promote continuity of treatment benefits.

Regional Goals: By the end of the 5-year DSRIP project, the proposed program will have established an approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient and family needs, improves health care outcomes and patient satisfaction, facilitates access to inpatient and outpatient specialty care services for the underserved population of people with IDD/ASD, to ensure that they receive the most appropriate care for their condition, regardless of where they live or their ability to pay. The project is expected to transform health care delivery from a disease-focused model of episodic

care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary re-hospitalizations, and builds on the accomplishments of our existing health care system.

Starting Point/Baseline:

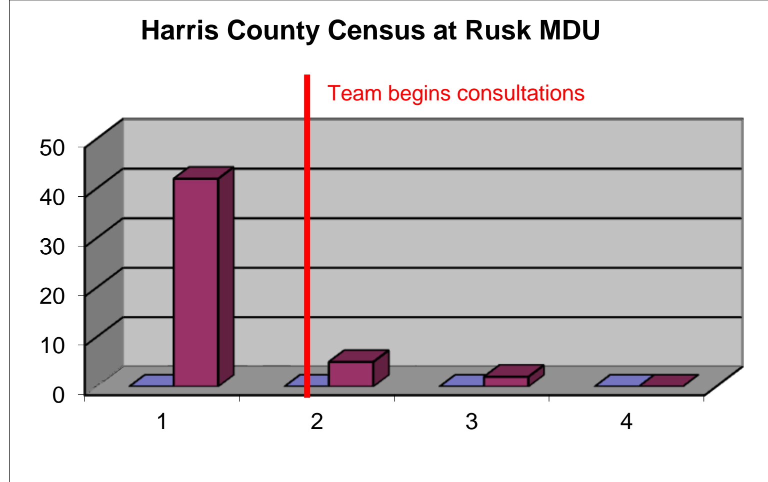
Annually, the current, reduced HCPC Consultation and Liaison (C&L) team consults and assists an average of 110 unduplicated patients each year; however, an increase was noted in the past year, when the team was called to consult on 150 cases. With increased pressure upon state supported living centers to discharge residents into communities, combined with reduced state hospital and state supported living center beds, more cases may be anticipated. Fifty percent of the cases seen by the team are new to MHMRA and can be linked to community resources to minimize the likelihood of recurrent crises. The present team capacity, however, can only address a limited number of patients within HCPC and cannot extend beyond that facility, where additional needs exist. Furthermore, discharge planning is a difficult task without an established protocol that contains a decision tree for linking to appropriate community options. The proposed project is intended to close these gaps.

Rationale:

The existence of co-occurring mental illness in people with IDD/ASD has been widely recognized; however, treatment of psychiatric conditions in this population is still in its infancy, with unremarkable treatment outcomes. Poor treatment outcomes include more frequent psychiatric hospitalizations; longer admissions and later identification in the psychiatric event, resulting in higher levels of care. Furthermore, studies examining the treatment of co-occurring disorders report that mental health clinicians, including psychiatrists, psychologists, social workers, nurses and other disciplines, are rarely formally trained to treat people with IDD/ASD and MI. Lack of exposure to people with developmental disabilities causes clinicians to shy away from these patients; and when they do become involved, they intervene later in the course of the disease process and tend to use medication for sedating purposes and not in accordance with the person's mental illness.

Texas has documented similar concerns. In May 2011, the directors of IDD programs in mental health authorities across Texas were queried about the resources in their areas for responding to behavioral crises. Across the state they reported a lack of skilled clinicians and also noted psychiatric hospitals often refused inpatient services to individuals with co-morbid IDD and psychiatric illness in crisis because they lacked expertise in the population. Conversely, when admitted, they had extended inpatient stays with little improvement in behavioral functioning. With no other alternative in Texas, communities turn to institutional care in State Supported Living Centers (formerly called State Schools) to manage and treat these individuals. This is an expensive choice. The current annual cost for a person with IDD in a state supported living center is $177,624.

Additionally, Harris County has documented a similar need among this population. Approximately 106,494 Harris county residents are diagnosed with an intellectual and developmental disability; 24,000 with autism spectrum disorder; and of people in these groups, 38,700 are dually diagnosed with co-occurring mental illness. When a person with a co-occurring condition requires hospitalization to stabilize symptoms of mental illness, they often encounter well-meaning clinicians who have limited exposure and experience in treating this



population. This situation can be alleviated with specialized consultation by clinicians who are experts in ID/ASD and co-occurring mental illness. Not only would effective consultation include recommendations for inpatient treatment, but recommendations for effective discharge planning and care transition would be necessary to reduce preventable rehospitalizations.

Care transitions refer to the movement of patients from one health care provider or setting to another. When a patient's transition is less than optimal, the repercussions can be far reaching (e.g., hospital readmission, an adverse medical event, and even mortality). Additionally, poorly designed discharge processes create unnecessary stress for medical staff causing failed communications, rework, and frustrations. A comprehensive and reliable discharge plan, along with post-discharge support, can reduce readmission rates, improve health outcomes, and ensure quality transitions. Safe, effective, and efficient care transitions and reduced risk of potentially preventable readmissions require cooperation among providers of medical services, social services, and support services in the community and in long-term care facilities. People with IDD/ASD and co-occurring mental illness are high-risk patients who often have multiple chronic diseases. The implementation of effective care transitions requires practitioners to learn and develop effective ways to successfully manage one disease in order to effectively manage the complexity of multiple diseases (Rittenhouse et al., 2010). The discontinuity of care during transitions typically results in patients with serious conditions falling through the cracks, which may lead to otherwise preventable hospital readmission (Parry et al., 2003).

The model MHMRA is proposing to implement has been tested previously with excellent results. In 1996, MHMRA assigned a team consisting of a psychiatrist, a psychologist, a social worker and a case worker to work within (HCPC) to identify people with IDD/ASD who were hospitalized with co-occurring mental illness and to consult as needed with the hospital's attending physician. When the team was first developed, the Multiple Disabilities Unit (MDU) at Rusk State Hospital housed, on average, 48 Harris County residents per day. With successful diversion by the team, within two years, the average daily census in the MDU from Harris County was reduced to five. It fell further to approximately two, until the MDU was closed for lack of use. This process is illustrated below.

The team was successful at reducing institutional placement, as indicated in the graph below, but over time, with successive funding reductions, the team, was equally reduced and lost state funding. By developing the team fully and expanding its scope, it is anticipated that the diversion of hospital patients into community options will represent substantial savings.

Project Components:

In order to develop such a program, option 2.12.2 was selected. The status of each component is noted, if that activity is currently underway:

a) MHMRA will review best practices from a range of models (e.g. RED, BOOST, STAAR,

INTERACT, Coleman, Naylor, GRACE, BRIDGE, etc.), with specific attention to models that include patients with IDD/ASD.

b) MHMRA will conduct an analysis of the key drivers of 30-day hospital readmissions using a chart review tool (e.g. the Institute for Healthcare Improvement's (IHI) State Action on Avoidable Re-hospitalizations (STAAR) tool) and patient interviews. A literature review has been started to help identify evidence-based factors, but patient and other stakeholder input will be the critical for this component.
c) MHMRA will integrate information systems so that continuity of care for patients is enabled. An electronic medical record is being developed that will interface with other systems seamlessly.
d) MHMRA will develop a system to identify patients being discharged potentially at risk of needing acute care services within 30-60 days
e) MHMRA will implement discharge planning program and post discharge support program. Pilot processes are being sampled and will contribute to lessons learned as this important component evolves
f) MHMRA will develop a cross-continuum team comprised of clinical and administrative representatives from acute care; skilled nursing; ambulatory care; health centers; HCS, ICF-ID and other Medicaid waiver providers; and home care providers of care to people with IDD/ASD.
g) MHMRA will conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for the targeted safety-net populations.

Community Needs: The Consultation and Liaison program will address the following community needs:

- CN2-Insuffcient Access to Behavioral Health
- CN5- Integrated Care for Behavioral Health
- CN12- Improved Access to Patient Education
- CN14-Reduction of ER Services

The improvement metrics chosen for this project was a measure of those receiving the service (I-11: Number over time of those patients in target population receiving standardized, evidence-based interventions). Determining the number of patients served will help determine the progress MHMRA is making toward our stated goals.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative: Currently, the team capacity is insufficient for the population in need of consultation and liaison services. Furthermore, discharge planning is a difficult task without an established protocol that contains a decision tree for linking to appropriate community options. The proposed project is intended to close these gaps in the service continuum.

Related Category 3 Outcome Measure(s):

IT-6.1 Percent improvement over baseline of patient satisfaction scores

Reasons/rationale for selecting the outcome measure:

Measurement of patient satisfaction is a key indicator of patient-centered care and has been targeted as a quality indicator by national organizations dedicated to improvement in patient outcomes, e.g. the National Council for Quality Assurance. Furthermore, if patients and their family are satisfied with services then we can assume they are being provided for adequately. On the other hand, if patients are dissatisfied having an avenue to express their concerns is important to empowering our clients.

Relationship to Other Projects: At this time there is not enough information available from the RHP to describe how this project may or may not be related to other RHP DSRIP proposals; however, the proposed project has activities related to the following MHMRA proposals: IDD Specialized Treatment and Rehabilitative Services (STARS) and IDD/ASD Wrap-around and In-home Services.

Relationship to Other Projects in the RHP: The behavioral health inpatient crisis in Region 3 is considerable and the increased capacity proposed in the RHP plan will only contribute a small impression into the overall community need for inpatient treatment. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is only similar to others in the sense of the category of behavioral health but is different in the sense that it focuses to inpatient bed capacity versus outpatient comprehensive treatments. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:
In the effort to value the proposed project accurately, assistance was sought from H. Shelton Brown, Ph.D. of the UT Houston School of Public Health and Thomas Bohman, Ph.D. of the UT Austin Center for Social Work Research. Their consultation was limited to only the valuation section of this document. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research) and additional information is reported on potential, future costs saved. The value of each of the above delivery systems will be reviewed separately. The total valuation will be the sum of the individual component valuations.

Valuations should be based on economic evaluation principles that identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of

interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency room visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard. The number of life-years added is based on a review of the scientific literature.

Cost-Utility Analysis: After an extensive review of the literature, no studies were located that contained an estimate of QALYs gained due to this intervention.

Cost-Effectiveness and Cost Savings: Cost-effectiveness analysis (CEA) is similar to CUA, except that the cost averted is compared to a common health outcome, such as cost per depression-free day. We did identify a benefit-cost study that is related.

After MHMRA of Harris County implemented this service in 1999, the state hospitalization rate was reduced by 97% for the following fiscal year. In the four years prior to the implementation of the consultation and liaison services in 1999, about 255 or 55.69% of those admitted to HCPC had an IDD diagnosis. Of the 255 people admitted to HCPC who had an IDD diagnosis between 1995 and 1998, 44.31% were subsequently sent to a state hospital, an average of 28.25 individuals per year.

The average cost of the state hospital was about $400 per day with an average length of stay of 197.49 days. These figures indicate that a savings of at least $41,622.99 could be expected if the program served 100 individuals. However, because these figures were from 1999 and the state hospital unit has since closed, we will not include this cost savings estimate in the final valuation amount.

Research has shown that care-givers of individuals with IDD/ASD are at risk for mental health problems of their own due to stress (Cummins, 2001). Past research has also linked aggression to parent distress (Chadwick, Beecham, Piroth, Bernard & Taylor, 2002; Douma, Dekker & Koot, 2006; Plant & Sanders, 2007; Weiss, Lunsky, Gracey, Canrinus & Morris, 2009). Parent training has been an effective tool to reduce stress related to caring for IDD/ASD individual, better ability to manage behaviors in the home and improved use of resources such as reduced ER visits (Hassiotis, Robotham, Canagasabey, Marston, Thomas & King, 2012). Through parent intervention, additional value can be gained. Using Ganz estimated indirect costs to family members caring for an individual with IDD/ASD at the average age of admission to HCPC (31 years) the yearly costs were estimated to be $8939.25.

100	(patients served)
x $8939.25	(annual indirect family costs)
= $893,925	**Cost Savings: Indirect Family**

Summary and Total Valuation: This valuation analysis shows that the intervention will have a positive value for participants who receive the intervention(s). The total valuation for this program is **$893,925 per year.**

Methodist Willowbrook Hospital

Pass 1

Project Option 2.17.1 - Design, implement, and evaluate interventions to improve care transitions from the inpatient setting for individuals with mental health and/or substance abuse disorders: Implement Care Transition Coordination

Unique Project ID#: 140713201.2.1

Performing Provider Name / TPI: *Methodist Willowbrook Hospital* / 140713201

Project Summary:

Provider:

Methodist is a delivery system comprised of 4 community hospitals, 1 academic medical center in the Texas Medical Center, research institute, physician organization which employs 350 physicians and operates multiple ancillary care sites throughout the Houston metropolitan area. Methodist has 13,867 employees and has 4,185 associated physicians. Methodist has been recognized as the top hospital system in Houston & Texas by US News & World Report and honored as the top ranked healthcare provider to work for by Fortune Magazine. Methodist Willowbrook Hospital's payor mix for Medicaid is 9.44% and 8.73% self pay.

Intervention(s):

By facilitating effective transitions of care to behavioral health and primary care through locations within Harris County including HARRIS HEALTH SYSTEM, MHMRA, private physicians, and SJMH Family Medicine Residency physicians we seek to help patients navigate a complicated health-care landscape, participate in mental health choices, increase their self-efficacy, provide better quality of life and prevent readmissions and prevent adverse outcomes of incarceration, chemical dependency or suicide. Outpatient Service Availability is limited, and so we hope to leverage the community mental health workers to connect and encourage care within existing primary care and mental health resources. The program will advocate primary care expansion for mental health, through the use of treatment algorithms and perhaps by embedding counselors within a primary practice who could bill "incident to" for supervised service.

Target Population:

About 140,000 adults in Harris County suffer from severe mental illness, while almost half of these adults had no access to treatment from the public or private health system. Our target population is defined as those individuals who suffer from any behavioral health related condition and who are seeking care in our facilities, more specifically those who are covered by Medicaid or without insurance coverage. At Methodist Willowbrook Hospital we serve those with behavioral health as detailed below:

Total ED Visits - Self Pay & Medicaid	22,059
Total ED Visits - Behavioral Health - Self Pay & Medicaid	760
Total ED Admissions - Self Pay & Medicaid	4,154
Total ED Admissions - Bahavioral Health - Self Pay & Medicaid	88
Total IP Admissions - Self Pay & Medicaid	3,326
Total IP Admissions - Behavioral Health - Self Pay & Medicaid	18

Category 1 or 2 expected patient benefits:

Our project will include a number program innovation and redesign efforts. These include ensuring we have recruiting qualified people to intervene and guide care, educate staff, identify community partners, re-engineering our discharge planning process to ensure patients transition into the ambulatory care setting successfully, setting up care coordination protocols to make sure we identify patient accurately who need our assistance and following our system's CQI efforts of plan, do, check and act to ensure we're achieving our expected outcomes for this target population.

Category 3 outcomes:

Our goal is that in the first year we will coordinate care follow-up post discharge to 20% and increase this to 80% by year 5.

Project Option 2.17.1 - Design, implement, and evaluate interventions to improve care transitions from the inpatient setting for individuals with mental health and/or substance abuse disorders: Implement Care Transition Coordination

Unique Project ID#: 140713201.2.1

Performing Provider Name / TPI: *Methodist Willowbrook Hospital* / 140713201

Project Description:

Preventing Behavioral Health Readmissions by Implementing Care Transition Coordination
According to Healthy Peoples 2010 Mental Illness is on par with heart disease and cancer as a cause for disability. 140,000 residents of Harris County suffer from Mental Illness.[i] Many have no access to treatment from the public or private health system. Almost 20,000 youths in Harris County are in need of treatment while only 24% of cases were addressed.[ii]

Currently in Harris County there are limited locations for follow-up mental health care services. The MHMRA services are provided through an office in Pasadena or League City, which is more than 30-45 minutes away and many patients have limited transportation and other barriers to follow up mental health care. Care can be received at the Harris Health System clinic in Baytown where existing patients have access to a visiting Psychiatrist on site 1 half-day per week. This same scenario of limited facilities and physicians to provide ongoing chronic behavioral health care services plays itself out in Central and Northwest Harris County.

There are many barriers to effective mental health care provision. These can be grouped as patient factors, physician factors and system factors. Primary care and primary care psychiatry working together are necessary to address the care of affective and other mental illnesses.[iii]
The intervention proposed will involve the use of community mental health workers with Behavioral Health Education who can coordinate the care of adult patients through the transition from inpatient care to outpatient levels of care including both mental health and primary care follow up. It will also include promoting and monitoring attendance at community settings such as chemical dependency programs. The community mental health workers will be located at The Methodist Hospital, San Jacinto Methodist Hospital and Methodist Willowbrook Hospital and will receive their case load from hospital discharges, referred discharges from Harris Health System who reside in these communities, and referrals from the Emergency Department.
The community mental health workers will have access to hospital medical records including discharge planning. Ideally the information from SJMH and Harris Health System may be available through shared information systems between EPIC software and Methodist IT platforms. This will involve a software program called Medicity, which is contained in Methodist Connect and Harris County Health Connect. It will also involve securing patient consent for this level of information exchange.

The community mental health worker will then follow recognized treatment protocols to query patient compliance with treatment and contact the primary care physician or mental health specialist. The care transition manager may refer to specialized disease management programs, such as those for alcohol or chemical dependency. To assist primary care physicians providing

mental health follow up, treatment algorithms can guide treatment selection and increased quality and consistency of treatment, provide better clinical outcomes, and more efficient use of health care resources. The care will be directed toward the use guidelines including the Texas Medication Algorithm Project, (TMAP).[iv] It will also include recommending sequenced care such as the Sequenced Treatment Alternatives to Relieve Depression, (STAR-D), which assist patients and clinicians implementing "next step" treatment options.[v] It involves patient-choice and buy-in as well as use of patient-completed rating scales such as the "Quick Inventory for Depressive Symptoms" to monitor response to treatment and alert when urgent outpatient mental health care or crisis intervention is necessary.[vi] Objective measurements such as this can assist the transitions nurse in evaluating severity or priority.

By facilitating effective transitions of care to behavioral health and primary care through locations within Harris County including Harris Health System, MHMRA, private physicians, and SJMH Family Medicine Residency physicians we seek to help patients navigate a complicated health-care landscape, participate in mental health choices, increase their self-efficacy, provide better quality of life and prevent readmissions and prevent adverse outcomes of incarceration, chemical dependency or suicide.

The costs associated with this program will include IT costs, Space Costs and Salary Costs.

Goals and Relationship to Regional Goals:

This project meets the following regional goals:

This program would meet the following three regional health goals #1 by leveraging and improving on existing programs and infrastructure. #2 by increasing access to primary and specialty care services, with a focus on underserved and the Medicaid populations. It will ensure patients receive the most appropriate and accessible care for their condition, regardless of where they live or their ability to pay. #3 It will transform from disease-centered emergency room care to patient-centered preventive approach to behavioral health care. It also reduced duplication of uncoordinated services currently received from county and private health care.

Challenges:

- Recruitment of qualified community mental health workers
- Recruitment of psychiatrists & acute care nurse practitioners
- Patient compliance

5-Year expected outcome for Performing Provider and Patient:

Focused effort to transition patients from the acute and ED setting with behavioral health conditions will improve outcomes and reduce costs. We aim to reduce repeat admissions to our inpatient psychiatric units and reduce repeat emergency room visits from our targeted population. Patients will benefit from a more hands-on, compassionate and integrated care coordination system for behavioral healthcare. This should translate to a reduction of demand for incarcerated patients with mental illness and an improvement in the daily productivity from those who benefit from our program.

Starting Point/ Baseline:

We can get a partial measure of the problem based on recent ED and inpatient admissions. To this we may add utilization at nearby facilities, but the data is not available at present.
At San Jacinto Methodist Hospital in 2011 there were 443 ED admissions with a primary diagnosis of a Mental Health condition, (187 were self-pay and Medicaid) resulting in a financial loss of $119k. At The Methodist Hospital there were 612 ED admissions with a primary diagnosis of a Mental Health condition resulting in a loss of $1.154M. At Methodist Willowbrook Hospital there were 160 ED admissions with a primary diagnosis of a Mental Health condition resulting in a loss of $6k. This may be an underestimate since it only captures primary diagnoses. There were 709 behavioral health admissions, 296 of which were self-pay and Medicaid, for a net financial loss of $324k.

It is estimated that 30-50% are readmitted within a one-year period based on national literature. Outpatient Service Availability is limited, and so we hope to leverage the community mental health workers to connect and encourage care within existing primary care and mental health resources. The program could advocate primary care expansion for mental health, through the use of treatment algorithms and perhaps by embedding counselors within a primary practice who could bill "incident to" for supervised service.

Rationale:

As referenced above, residents of Harris County have difficulty accessing mental health services.

The stated principles of the Harris County behavioral health system include quick, easy and convenient entry into services, full range of services and minimal financial barriers to necessary services. The principles promote recovery, continuity of care, family integration in care, evidence based care, and where possible co-location of behavioral health and general health care. HC Behavioral Health promotes stability of behavioral health conditions by decreasing relapse of mental illness and substance abuse.

A designated mental health professional provides oversight to the care-management team to provide this collaborative care.[vii] There are many examples of collaborative care management.[viii],[ix],[x]

Project Components:

a. Develop a cross-continuum team comprised of clinical and administrative representatives from acute care, ambulatory care, behavioral health and community-based non-medical supports
    a. *We will develop a team of clinical leaders from various care settings to ensure care delivery is integrated and coordinated.*
b. Conduct an analysis of the key drivers of 30-day hospital readmissions for behavioral health conditions using a chart review tool
    a. *We will review each chart and develop a trending report of complications from each patient who is readmitted. Our teams will use this information to ensure we are incorporating the appropriate care pathways while the patients are in the*

hospital and we will also make any changes to our discharge planning process as needed to reduce readmissions.

c. Identify baseline mental health and substance abuse conditions at high risk for readmissions
   a. *We will begin with a retrospective review of all behavioral health related readmissions to identify trends. On a go-forward basis, we will review each chart and develop a trending report of complications from each patient who is readmitted. These reports will be updated to ensure we are identifying those patients who are at high risk for readmissions.*

d. Review best practices for improving care transitions from a range of evidence-based or evidence-informed models
   a. *Our teams will work collaboratively with other groups focused on reducing readmissions and incorporate their best practices to our patient population.*

e. Identify and prioritize evidence-based strategies and clinical protocols that support seamless care transitions and reduce preventable 30-day readmissions.
   a. *Our teams will utilize the plan, do, check, act approach of continuous quality improvement for this project. Using this approach will ensure that we are identifying and prioritizing care transactions and reduce readmissions.*

f. Implement two or more pilot intervention(s) in care transitions targeting one or more patient care units or a defined patient population.

g. *Conduct quality improvement for project using methods such as rapid cycle improvement.*

The project will focus primarily on items b, c, d and e of the above listed components.

Unique community need identification number the project addresses:
CN.3 - Inadequate access to behavioral health care

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project represents the first time a focused, coordinated care navigation effort has been targeted at patients who suffer from behavioral health conditions. We feel that this project will significantly reduce unnecessary emergency department utilization & repeat admissions into inpatient psychiatric units.

Related Category 3 Outcome Measures:
OD-1: Primary Care and Chronic Disease Management
IT-1.18 Follow-Up After Hospitalization for Mental Illness- NQF 0576236 (Standalone measure)
Reasons/rationale for selecting the outcome measures:
Rationale for choice of using one standalone measure is that is most specific for the intervention. It has been well established that unnecessary readmissions can be prevented by implementing various measures to ensure outpatient follow-up.[xi]

Rate 1: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 30 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.
Our goal is that by year four we will have 60% with follow up within 30 days, and by year 5 we will have 80%.

Rate 2: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 7 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.
As it is difficult to arrange appointments so close to discharge because of patient and physician factors, our goal is that by the fourth year we will have 40% follow up within seven days and by the fifth year, 50%.

Relationship to other Projects: This project may share space with an OB care coordinator program run by SJMH, and may have overlapping patients.

Relationship to other Performing Providers Projects within the RHP:
The behavioral health crisis in Region 3 is considerable and the proposed initiatives in our RHP plan will only imply a small impression into the overall community need for treatment, but is a good start. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is similar to many others in the sense of the category of behavioral health. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Multiple other Behavioral Health Innovations include care navigators, transition coaches, or case managers. We seek to participate in lessons-learned with all of these programs. We also plan to collaborate with entities receiving Federal SAMSHA funding such as Community Mental Health services block grant, Substance Abuse Prevention and Treatment Block Grant or other mental health and substance abuse grants, (Harris County Adult Treatment STAR Drug Courts, TI021529). The transition nurse would be reaching out to connect the patient with right source of care.

Plan for Learning Collaborative:
We plan to participate in a region-wide learning collaborative as offered by the anchor for Region 3, Harris Health System. Our participation in this collaborative with other performing providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's health care system.

Project Valuation:
All milestones and metrics were given equal weight and valuation for this project.

OakBend Medical Center

Pass 1

Project Option: 2.4.1 Redesign to Improve Patient Experience - Implement Consumer Assessment System
Performing Provider: OakBend Medical Center (OBMC) / 127303903
Unique Project ID: 127303903.2.1

- Provider: OakBend Medical Center is a stand-alone hospital authority that was established in October 1947 under the original name of Polly Ryon Memorial Hospital. OakBend Medical Center has grown to a hospital system, still governed by a hospital authority. It has expanded to two hospital locations, two diagnostic imaging centers, an outpatient surgical center, a free-standing Emergency Room and a Medical Group with 7 clinic locations. The Medical Group consists of Family Practice, OB/Gyn, Infectious Disease, Podiatry, Orthopedic, Cardiology and Interventional Cardiology. OakBend was able to provide more than $29,412,325 in charity care through September during FY 2012.

Volume Statistics - FY2012	**Patient Payor Mix–YTD 9/12**	**Patient Demographics**
Hospital admissions- 5,453 Births (babies delivered)- 1,080 Emergency visits- 23, 433	Self-Pay- 13.8% Medicaid and CHIP- 19.5% Medicare- 40.1% Other Funding- N/A Commercial Insurance- 26.6	Hispanic- 39.6% African American- 16.7 Caucasian- 34.6 Asian- 2.0 Other- 6.7 American Indian- 0.4

- Intervention(s): OBMC plans to establish a patient experience program where patients feel safe, have their voices heard and are empowered. This concept would involve staff education on communication skills and will be in line with the other initiatives that are designed to create an environment that promotes excellence, operational efficiency and quality patient-centered care

- Need for the project: This project addresses the RHP's goal to "[d]evelop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes."

- Target population: All patients that seek their medical care through any of the OakBend Medical Center system entities, who will benefit from this and other projects. We plan to target all inpatients.

- Category 1 or 2 expected patient benefits: The goal of this project is to change the organizational culture to improve the patient experience, where patient's feel safe, have their voices heard and are empowered.

- Category 3 outcomes: IT-6.1- In DY3 we plan to increase improvement over baseline by 1%, in DY4 by 2% and in DY5 by 3%

Title: Redesign to Improve Patient Experience - Implement Consumer Assessment System

Unique RHP Project Identification Number: 127303903.2.1

Performing Provider Name/TPI: OakBend Medical Center (OBMC) / 127303903

Project Description: 2.4 / 2.4.1

OBMC plans to establish a patient experience program where patients feel safe, have their voices heard and are empowered. This concept would involve staff education on communication skills and will be in line with the other initiatives that are designed to create an environment that promotes excellence, operational efficiency and quality patient-centered care. The program will be established to encompass any patient experience in all OBMC facilities.

Patient experience with care will be assessed through focused surveys. The architecture for patient-focused surveys should be modeled after the Consumer Assessment of Healthcare Providers and Systems (CAHPS) tool, which includes the following domains: patients are getting timely care, appointments, and information; how well providers communicate with patients; patients' rating of provider; and assessment office staff.

OBMC will establish a Hospital Consumer Assessment of Healthcare Provider and Systems (HCAHPS) Steering committee, which will be comprised of organizational leaders, employees, and patients via their feedback. OBMC will then develop or improve upon a curriculum that will focus on staff education, communication skills and cultural diversity, as well as develop a formal policy and procedure that incorporates the communication model to include training staff on program goals and objectives. This will include competency training for all healthcare providers. We will incorporate the communication training model into the annual employee competencies. The training module will include coaching, shadowing and a feedback process. This process is designed to ensure that the knowledge acquired will be retained and performed on an ongoing basis.

Goal(s) and relationship to Regional goal(s):

Project goals:

The goal of this project is to change the organizational culture to improve the patient experience.

This project meets the following Region 3 goals:

This project addresses the RHP's goal to "[d]evelop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes."

Challenges and how addressed:

Challenges include: population diversity, language barriers, implementation and ongoing monitoring, training for healthcare providers, overcoming past negative experiences; tools to identify service issues during stay; to improve performance on at least one of the three composite

measures on the HCAHPS. OBMC will address these challenges by taking the steps outlined in this project narrative; in particular, OBMC will ensure that the program created under this project will effectively serve the diverse populations receiving care at OBMC. One step is to hire more bilingual staff to assist with the language barriers.

5-year expected outcome for provider and patients:

Improved patient satisfaction and provider performance which is better tailored to the needs of patients as expressed through the assessment system. We plan to do this by improving communication with patients and their families, which will lead to increased quality. Both of these positive metrics will lead to improved HCHAPS scores.

Starting Point/Baseline:

Baseline data:

OBMC currently uses patient satisfaction surveys in a limited number of clinical units and will use this data as a baseline for future project progress.

Time period for baseline:

1/1/12 to 6/30/12

Rationale:

Reasons for selecting the project option:

The feedback gained from this project will help OBMC develop tools to identify service issues during the patient's stay so that corrective action may be implemented at that time. It will also allow OBMC to critique and revise the training process as indicated by the results achieved. These metrics will be shared with all employees on a monthly basis, highlighting for the staff possible ways to enhance the patient experience and as evidenced by our HCAHPS scores.

Project components:

We will meet the following core components:

f) Organizational integration and prioritization of patient experience.
g) Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience.
h) Implementing processes to improve patient experience in getting through to the clinical practice.
i) Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures.

Milestones and Metrics:

The following milestones and metrics were chosen for the Implement Consumer Assessment System project based on the core components and the needs of the target population:
Process Milestones and Metrics: P-1 (P-1.1); P-3 (P-3.1); P-18 P-18.1

Improvement Milestones and Metrics: I-16 (I-16.1)

Unique community need identification number the project addresses:

CN.9: High rates of preventable hospital readmissions

CN-11: High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

OBMC currently uses patient satisfaction surveys in a limited number of clinical units. However, this project will allow OBMC to expand the use of patient satisfaction surveys and, more importantly, establish an infrastructure of accountability where the results of these surveys are examined by a steering committee, supported by active feedback from physicians and other practitioners, and eventually incorporated into the hospital's infrastructure.

Related Category 3 Outcome Measure(s):

IT-6.1 Percent Improvement Over Baseline of Patient Satisfaction Scores (Standalone Measure)

Reasons/rationale for selecting the outcome measure(s):

This outcome measure is explicitly related to the improvement of patient satisfaction, which is also the express purpose of this project.

Relationship to Other Projects:

How project supports, reinforces, and enables other projects:

This project will lay a foundation for, and reinforce the clinical effectiveness of OBMC's other DSRIP projects, including:

127303903.2.2: Establish Patient Care Navigation Program

127303903.1.3: Implement and Utilize Disease Management Registry

Relationship to Other Performing Providers' Projects in the RHP:

Healthcare treatment cannot focus to only the acute or chronic encounter and properly treat the patient. It is critical that our region focuses to patient education and community education to ensure a proactive and responsive approach to healthcare needs. The education models represented in the Region 3 RHP plan can be identified in the Initiative Grid (addendum)

and all focus to outcome measures such as appropriate utilization, patient satisfaction scores, and stand alone chronic condition scores such as diabetes and asthma.

Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Approach for valuing project:

OBMC values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing this project, OBMC took into account the extent to which the implementation of a consumer assessment system would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and the resources and cost necessary to implement the project.

Rationale/justification for valuation:

The implementation of a consumer assessment system will promote and encourage patients to access care, and foster a relationship of trust and communication between patients and providers—ultimately leading to better clinical outcomes for the community. OBMC took these potential effects into account when considering the appropriate incentive payment value for this project.

Project Option: 2.9.1 Establish Patient Care Navigation Program
Performing Provider: OakBend Medical Center (OBMC) / 127303903
Unique Project ID: 127303903.2.2

- Provider: OakBend Medical Center is a stand alone hospital authority that was established in October 1947 under the original name of Polly Ryon Memorial Hospital. OakBend Medical Center has grown to a hospital system, still governed by a hospital authority. It has expanded to two hospital locations, two diagnostic imaging centers, an outpatient surgical center, a free-standing Emergency Room and a Medical Group with 7 clinic locations. The Medical Group consists of Family Practice, OB/Gyn, Infectious Disease, Podiatry, Orthopedic, Cardiology and Interventional Cardiology. OakBend was able to provide more than $29,412,325 in charity care through September during FY 2012.

Volume Statistics - FY2012	**Patient Payor Mix–YTD 9/12**	**Patient Demographics**
Hospital admissions- 5,453 Births (babies delivered)- 1,080 Emergency visits- 23, 433	Self-Pay- 13.8% Medicaid and CHIP- 19.5% Medicare- 40.1% Other Funding- N/A Commercial Insurance- 26.6	Hispanic- 39.6% African American- 16.7 Caucasian- 34.6 Asian- 2.0 Other- 6.7 American Indian- 0.4

- Intervention(s): Patient Navigators will help and support these patients to navigate through the continuum of health care services. Patient Navigators will ensure that patients receive coordinated, timely, and site-appropriate health care services. Navigators may assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the Emergency Department to site-appropriate locations.

- Need for the project: Traditionally, a hospital's care of patients ends the instant the patient is discharged. This project will offer targeted patient populations assistance in coordinating their care. In addition to helping individual patients, this project will allow all providers across the spectrum of care to utilize their resources more efficiently, delivering care to patients in the most appropriate setting. This will result in lower costs for the delivery system and higher patient satisfaction.

- Target population: All patients that seek their medical care through any of the OakBend Medical Center system entities, who will benefit from this and other projects. We plan to target patients with Medicaid, CHIP and Self-Pay, especially those with chronic disease(s).

- Category 1 or 2 expected patient benefits: In DY3 we plan to increase the number of PCP referrals for patients without a medical home who use the ED, urgent care and/or hospital services as their primary means for access to healthcare.

- Category 3 outcomes: IT 3.2 – Our goal is to increase scheduled appointments over baseline to PCP's and SCP's, by 2% in DY3, by 5% in DY4 and by 8% in DY5.

Title: Establish Patient Care Navigation Program

Unique RHP Project Identification Number: 127303903.2.2

Performing Provider Name/TPI: OakBend Medical Center (OBMC) / 127303903

Project Description: 2.9 / 2.9.1

Patient Navigators will help and support these patients to navigate through the continuum of health care services. Patient Navigators will ensure that patients receive coordinated, timely, and site-appropriate health care services. Navigators may assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the Emergency Department to site-appropriate locations. OBMC will implement and coordinate post-discharge support for patients with congestive heart failure (CHF), Diabetes, and Chronic Obstructive Pulmonary Disease (COPD). Education would begin upon admission for these specific diagnoses and follow throughout the acute inpatient stay and into the post-discharge phase.

Those patients without a Primary Care Physician (PCP) would be set up with one from OakBend Medical Group (OMG) or the Fort Bend Family Health Center (FBFHC), and the initial appointment would be coordinated and scheduled in conjunction with the patient's availability, prior to the patient being discharged home. A follow-up call by a Community Health Worker (CHW) to remind the patient of the appointment 48-72 and again 24 hours prior to the appointment will be made. During the 48-72 hour prior appointment call, confirmation that the patient has transportation to get to the appointment would be confirmed. This coordination for transportation would be scheduled at least 24 hours in advance.

If no transportation is available, the CHW will, in collaboration with United Way, Red Cross and the County Transportation Service, coordinate to ensure that the patient has transportation to the physician office appointment.

Patient Navigators will help and support patients to navigate through the continuum of health care services. Patient Navigators will ensure that patients receive coordinated, timely, and site-appropriate health care services. Navigators may assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the Emergency Department to site-appropriate locations.

Goal(s) and relationship to Regional goal(s):

Project goals:

The goal of this project is to utilize community health workers, case managers, or other types of health care professionals as Patient Navigators to provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients.

This project meets the following Region 3 goals:

This project addresses the RHP's goal to "[d]evelop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional

collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes."

Challenges and how addressed:

Developing a well-planned-out support system which includes education for the patient/family/caregivers; promoting and incentivizing the patient population to utilize available services in lieu of the Emergency Department (ED); hiring and training of CHWs; managing non-compliant patients; space allocation for CHWs; establishing a more focused coordination between the hospital and affiliated medical group physicians, FBCHC, the CHW and other entities to achieve the shared goal of decreased avoidable readmissions; coordination of medical information from the specific HH companies with feedback to the patient's PCP and hospital CM staff if necessary. OBMC will structure this project in order to overcome these challenges, in part through careful planning of the project, and in part through conducting ongoing quality improvement activities for the project upon its implementation.

5-year expected outcome for provider and patients:

Improved health outcomes for patients who require post-discharge care.

<u>Starting Point/Baseline</u>:

<u>Baseline data</u>:

OBMC currently does limited post-discharge support for a small subset of its patient population (Medicare patients with certain conditions).

<u>Time period for baseline</u>:

1/1/12 to 6/30/12

<u>Rationale</u>:

Reasons for selecting the project option:

Traditionally, a hospital's care of patients ends the instant the patient is discharged. This has resulted in fragmented or overlapping care that is complicated for patients to access and navigate. This project will offer targeted patient populations assistance in coordinating their care. In addition to helping individual patients, this project will allow all providers across the spectrum of care to utilize their resources more efficiently, delivering care to patients in the most appropriate setting. This will result in lower costs for the delivery system and higher patient satisfaction.

Project components:

The core components of this project will be:

j) Identify frequent ED users and use Patient Navigators as part of a preventable ED reduction program. Train Patient Navigators in cultural competency.
k) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as Patient Navigators.
l) Connect patients to primary and preventive care.
m) Increase access to care management and/or chronic care management, including education in chronic disease self-management.
n) Conduct quality improvement for the project, using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Unique community need identification number the project addresses:

CN.8: High rates of inappropriate emergency department utilization

CN.9: High rates of preventable hospital readmissions

CN.10: High rates of preventable hospital admissions

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

OBMC currently does limited post-discharge support for a small subset of its patient population (Medicare patients with certain conditions). This program would allow OBMC to expand the level of post-discharge support by dedicating personnel and resources, offering enhanced support such as transportation, and offering the navigation services to all patients with certain targeted conditions.

Related Category 3 Outcome Measure(s):

IT-9.2 ED Appropriate Utilization (Standalone Measure)

Reasons/rationale for selecting the outcome measure(s):

If the project is successful, then it will result in improved access to care for patients with targeted conditions. By improving access to care and ensuring that patients receive the right care in the right setting, this project will reduce the inappropriate use of the Emergency Department to deliver the same care.

Relationship to Other Projects:

How project supports, reinforces, and enables other projects:

This project will lay a foundation for, and reinforce the clinical effectiveness of, OBMC's other DSRIP projects, including:

127303903.1.1: Implement and Utilize Disease Management Registry Functionality
127303903.1.2: Increase the number of primary care providers (PCP's)
127303903.1.3: Expand Specialty Care Capacity

Relationship to Other Performing Providers' Projects in the RHP:

The ability to properly identify and monitor specific patients with chronic conditions or frequent emergency department utilization trends will allow the region to accurately mange the very large patient base. Patient navigation includes a comprehensive list of tasks as well as unique provider types based on the focus of the initiative and will help the focus of cost containment, emergency department utilization, and chronic disease management. The Region 3 Initiative Grid in the addendum allows for a cross reference of all initiatives proposed within this concept.

Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Approach for valuing project:

OBMC values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing this project, OBMC took into account the extent to which the implementation of a patient care navigation program would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and the resources and cost necessary to implement the project.

Rationale/justification for valuation:

The implementation of a patient care navigation program will significantly improve access to both primary and specialty care for targeted patient populations, foster the more efficient use of the community's healthcare resources, and ultimately result in the reduction of healthcare costs; therefore, OMBC took these factors into account when considering the appropriate incentive payment value for this project.

- Intervention(s): OBMC will educate and train patients and staff on the health benefits of breastfeeding, as well as evidence-based strategies to enhance breastfeeding. In furtherance of this goal, OBMC will partner with Fort Bend Family Health Center (FBFHC) to educate their staff and the community on the importance of initiating early breastfeeding. The training will incorporate the development of educational materials in both Spanish and English.

- Need for the project: One of the Region's goals is to "[t]ransform health care delivery from a disease-focused to a wellness model. Breastfeeding has been shown to have a positive impact on infant health. By implementing an evidence-based program aimed at promoting breastfeeding, OBMC can make an effort to increase the incidence of breastfeeding in the community.

- Target population: This project is explicitly tied to postnatal care and we plan to target patients with Medicaid, CHIP and Self-Pay.

- Category 1 or 2 expected patient benefits: The implementation of an evidence-based breastfeeding promotion program will directly contribute to the health outcomes of the community and has been linked to a reduction in chronic diseases later in life.

- Category 3 outcomes: IT-8.1 In DY3 we plan to increase improvement over baseline by 2%, in DY4 by 4% and in DY5 by 6%.

Project Option 2.6.1: Engage in population-based campaigns or programs to promote healthy lifestyles using evidence-based methodologies including social media and text messaging in an identified population- Implement Evidence-Based Health Promotion Programs – Breastfeeding Promotion Program

Unique RHP Project Identification Number: 127303903.2.3 / Pass 2

Performing Provider Name/TPI: OakBend Medical Center (OBMC) / 127303903

Project Description:

OBMC will educate and train patients and staff on the health benefits of breastfeeding, as well as evidence-based strategies to enhance breastfeeding. In furtherance of this goal, OBMC will partner with Fort Bend Family Health Center (FBFHC) to educate their staff and the community on the importance of initiating early breastfeeding. This program will utilize a structured approach that incorporates training, motivation and specific practices for implementation.

This program will involve training staff on the evidence-based strategies to promote exclusive breastfeeding during the initial hospitalization of the mother. Because evidence has shown that the health benefits of breastfeeding, and the mechanisms by which human milk confers protection against disease is essential. The training will incorporate the development of educational materials in both Spanish and English to be used at the educational sessions. The educational sessions will begin in the prenatal phase and continue through postpartum. The infant will be placed skin to skin and breast feeding initiated within the first 30 minutes of life. This will improve both clinical outcomes as well as quality of life.

During the educational process, staff and parents will be instructed on procedures and techniques, including hands-on modules that demonstrate correct positioning, skin to skin techniques, and proper latch, as well as the nutritional benefits of breastfeeding for baby and mother.

Goal(s) and relationship to Regional goal(s):

Project goals:

The goal of this project is to implement evidence-based strategies to promote infant wellness by developing an exclusive breastfeeding program at OBMC that will be initiated immediately following the birth of the newborn. An estimated 8.3% of babies are born with a low birth weight and nearly 40% of pregnant mothers receive no prenatal care in the first trimester. Early education of this population will improve the overall health of the community. There are, of course, financial benefits including, no need for bottles, bottle supplies and formula, which, can cost between $800 and $1200 per year. Breastfeeding also slows the fertility process, helping to space out children and create less strain on the family's budget.

This project meets the following Region 3 goals:

One of the Region's goals is to "[t]ransform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient

satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system[.]" This project puts emphasis on establishing wellness and patient-centered interaction, rather than only reacting to and focusing on disease. This is a proactive approach to patient care.

Challenges:

The top challenge in developing this initiative is the language diversity of the population served at OBMC, as well as the cultural diversity and the level of education of the patients. An additional challenge will be recruiting and hiring an International Board Certified Lactation Consultant (IBCLC) who will coordinate the training sessions for physicians, nurses and parents. OBMC plans to hire the lactation consultant during milestone year two (2) of this project. The lactation consultant will be responsible for coordinating the educational sessions, performing competency assessment on staff, providing hands on and ongoing evidence based education as well as compiling and maintaining statistical data and implementing quality improvement strategies to achieve the desired outcomes.

5-year expected outcome for provider and patients:

All mothers who deliver at OBMC will be educated on the benefits of breastfeeding and the nutritional value human milk provides for their infants. OBMC will be a community resource for all breastfeeding mothers. The resource center will provide training sessions, educational information as well as equipment to assist mothers in achieving successful breastfeeding.

Starting Point/Baseline:

Baseline data:

OBMC does not currently have a certified lactation consultant on staff or a comprehensive program to promote breastfeeding. OBMC is in the process of searching for a certified breastfeeding consultant and will have this person in place by Milestone year two (2).

Time period for baseline:

1/1/12 to 6/30/12

Rationale:

Reasons for selecting the project option:

Breastfeeding has been shown to have a positive impact on infant health. By implementing an evidence-based program aimed at promoting breastfeeding, OBMC can make an effort to increase the incidence of breastfeeding in the community. This is a proven method of improving health outcomes and increasing patient satisfaction. This will improve both clinical outcomes as well as quality of life.

Project components:

The project will include opportunities to expand to a broader patient population, and identify key challenges associated with expansion of the project, including special considerations for safety-net populations.

Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

- One of OakBend's milestones in Year 4 is to implement a continuous quality improvement plan by establishing meetings with other RHP providers.

Unique community need identification number the project addresses:

- CN.20- Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs
- CN.14- High rates of poor birth outcomes and low birth-weight babies

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

Although OBMC currently provides some information and guidance regarding breastfeeding, this would be a significant expansion of the program by increasing the amount of education available to both patients and staff. We plan to implement a dedicated breastfeeding resource department that is equipped with information in English and Spanish, as well as the availability of equipment and interactive training modules to better facilitate learning. The hiring of a full-time certified lactation consultant would also dedicate significantly more resources to this goal. Efforts will also be made to follow up with the patients to determine whether they are still breastfeeding post discharge This Project allows OBMC to participate in a learning collaborative and inter-agency coordination effort with other entities who's focus is to improve quality of life for the mother and infant.

Related Category 3 Outcome Measure(s):

IT-8.1 Timeliness of Prenatal/Postnatal Care

Reasons/rationale for selecting the outcome measure(s):

This project is explicitly tied to postnatal care. Therefore, it is reasonable to measure other areas of prenatal/postnatal care.

Relationship to Other Projects:

How project supports, reinforces, and enables other projects:

This project will lay a foundation for, and reinforce the clinical effectiveness of, other DSRIP projects such as:

1.1 Expand Primary Care Capacity

2.4 Redesign to Improve Patient Experience

2.7 Implement Evidence-Based Disease Prevention Programs

Relationship to Other Performing Providers' Projects in the RHP:

Healthcare treatment cannot focus to only the acute or chronic encounter and properly treat the patient. It is critical that our region focuses to patient education and community education to ensure a proactive and responsive approach to healthcare needs. The education models represented in the Region 3 RHP plan can be identified in the Initiative Grid (addendum) and all focus to outcome measures such as appropriate utilization, patient satisfaction scores, and standalone chronic condition scores such as diabetes and asthma.

Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Approach for valuing project:

OBMC values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project.

In valuing this project, OBMC took into account the extent to which the implementation of an evidence-based breastfeeding promotion program would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and the resources and cost necessary to implement the project.

Rationale/justification for valuation:

The implementation of an evidence-based breastfeeding promotion program will directly contribute to the health outcomes of the community and has been linked to a reduction in chronic diseases later in life. OBMC took these potential effects into account when considering the

appropriate incentive payment value for this project. OBMC has identified the space and is currently advertising for a certified lactation consultant to begin the process

Oakbend Medical Center

Pass 3

Project Option: 2.14.3 Other Patient-Centered Wellness Management Program
Performing Provider: OakBend Medical Center (OBMC)/127303903
Unique Project ID: 127303903.2.4

- Provider: OakBend Medical Center is a stand-alone hospital authority that was established in October 1947 under the original name of Polly Ryon Memorial Hospital. OakBend Medical Center has grown to a hospital system, still governed by a hospital authority. It has expanded to two hospital locations, two diagnostic imaging centers, an outpatient surgical center, a free-standing Emergency Room and a Medical Group with 7 clinic locations. The Medical Group consists of Family Practice, OB/Gyn, Infectious Disease, Podiatry, Orthopedic, Cardiology and Intervential Cardiology. OakBend was able to provide more than $29,412,325 in charity care through September during FY 2012.

Volume Statistics - FY2012	Patient Payor Mix–YTD 9/12	Patient Demographics
Hospital admissions- 5,453 Births (babies delivered)- 1,080 Emergency visits- 23,433	Self-Pay- 13.8% Medicaid and CHIP- 19.5% Medicare- 40.1% Other Funding- N/A Commercial Insurance- 26.6	Hispanic- 39.6% African American- 16.7 Caucasian- 34.6 Asian- 2.0 Other- 6.7 American Indian- 0.4

- Intervention(s): OBMC will formalize partnerships with local community agencies to work on projects specifically dedicated to health and wellness promotion such as Fort Bend Family Health Center (FBFHC), United Way, Weight Watchers, OBMC (OakBend Medical Group) and other agencies. We will form a task force of community members from each of the different agencies to do a needs assessment to determine targeted areas where a wellness management program in English and Spanish would be beneficial.

- Need for the project: This project directly relates to the Regional goal to "[t]ransform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services including hospital admissions, and builds on the accomplishments of our existing health care system[.]"

- Target population: All patients that seek their medical care through any of the OakBend Medical Center system entities, who will benefit from this and other projects. We plan to target patients with Medicaid, CHIP and Self-Pay, especially those with chronic disease(s).

- Category 1 or 2 expected patient benefits: OBMC does not currently operate a wellness program. However, OBMC has identified a minimum of five patient populations that would benefit from this wellness program. Most of these patients overlap to more than one population, which only increases the likelihood of non-compliance and poor quality of life.

- Category 3 outcomes: IT□3.4 In DY3 we plan to train staff and decrease inappropriate use of emergency department care by 2% over baseline, in DY4 by 5% and in DY5 by 8%.

Project Option 2.14.3: "Other" project option: Implement other evidence-based project to implement person-centered wellness self-management strategies and self-directed financing models that empower consumers to take charge of their own health care– Patient-Centered Wellness Management Program

Unique RHP Project Identification Number: 127303903.2.4 / Pass 3

Performing Provider Name/TPI: OakBend Medical Center (OBMC) / 127303903

Project Description:

OBMC will formalize partnerships with local community agencies to work on projects specifically dedicated to health and wellness promotion such as Fort Bend Family Health Center (FBFHC), United Way, OakBend Medical Group (OBMG), Weight Watchers and other agencies. We will form a task force of community members from each of the different agencies to do a needs assessment to determine targeted areas where a wellness management program would be beneficial.

This project will involve hiring and training of wellness staff, care coordination, development of educational materials, outreach to community of services offered in bilingual availability, access to or expanded transportation services as well as coordination for transportation, reminder calls to recipients regarding appointment times, eventually a help line for access of services offered, and printed educational materials in multiple languages. Depending on the needs assessment, outreach nurses, physical therapists or physical therapy assistants, dieticians and chaplaincy services, along with transportation coordination with Fort Bend County and other agencies providing such services, would be required. The project will also involve meetings led by nephrologists, cardiologists, pulmonologists and dieticians, etc to conduct awareness and education seminars for patients with end-stage renal diseases, congestive heart failure, COPD, diabetes and obesity.

Goal(s) and relationship to Regional goal(s):

Project goals:

The goal of this project is to create a wellness, self-management program that employs research-supported interventions, singly or in combination, to help individuals manage their chronic physical and behavioral health conditions.

This project meets the following Region 3 goals:

This project directly relates to the Regional goal to "[t]ransform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services including hospital admissions, and builds on the accomplishments of our existing health care system[.]"

Challenges:

Formalizing partnerships.

5-year expected outcome for provider and patients:

Improved management and compliance with treatment regimens of chronic conditions for patients, particularly patients with renal disease, COPD, congestive heart failure, diabetes and obesity.

Starting Point/Baseline:

Baseline data:

OBMC does not currently operate a wellness program. However, OBMC has identified a minimum of five patient populations, listed above, that would benefit from this wellness program. Most of these patients overlap to more than one population, which only increases the likelihood of non-compliance and poor quality of life.

Time period for baseline:

1/1/12 to 6/30/12

Rationale:

Reasons for selecting the project option:

This project will help OBMC to successfully engage the individual consumer in disease self-management and wellness activities related to chronic physical and behavioral health conditions, and empower person-centered recovery and improved health outcomes. This will improve both clinical outcomes as well as quality of life. Giving the individual consumer control over health resources is another complementary promising practice. Evidence has shown that navigation and support from community health workers and case managers trained in Motivational Interviewing resulted in increased access to and use of appropriate health services, including: more use of preventative care; more outpatient visits; more mental health and dental visits; greater adherence and persistence in taking prescribed medications for chronic conditions such as hypertension, respiratory conditions, diabetes, and high cholesterol; more medical stability for chronic conditions; and greater satisfaction with healthcare.

Project components:

Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

- One of OakBend's milestones in Year 4 is to implement a continuous quality improvement plan by establishing meetings with other RHP providers.

Unique community need identification number the project addresses:

- CN.20- Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs
- CN.23- Lack of patient navigation, patient and family education and information programs

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

This project will allow OBMC to deliver care in a much more coordinated and collaborative manner than it currently does. It will allow OBMC to participate in a learning collaborative and inter-agency coordination effort with other entities who's focus is to improve both access to and understanding of healthcare. This type of disease specific, patient-centered comprehensive wellness program would be a totally new initiative for OBMC.

Related Category 3 Outcome Measure(s):

IT-3.4 Renal Disease 30-Day Readmission Rate

Reasons/rationale for selecting the outcome measure(s):

OBMC has a relatively large population with all of the above listed chronic disease conditions. Part of the wellness program will be specifically targeted to these patient populations, Therefore, measuring the readmission rate for these chronic diseases will be a reasonable measure of this project's success because better disease management should result in fewer readmissions for manageable diseases. Currently over 45% of our patient population either has Medicaid or are Indigent. We foresee a significant improvement in access to healthcare in this payer population. That percentage equates to approximately 3,215 inpatient admissions in 2011.

Relationship to Other Projects:

How project supports, reinforces, and enables other projects:

This project will lay a foundation for, and reinforce the clinical effectiveness of, other DSRIP projects such as:

- 1.10 Enhance Performance Improvement and Reporting Capacity
- 2.2 Expand Disease Specific Chronic Care Management Models
- 2.4 Redesign to Improve Patient Experience
- 2.5 Redesign for Cost Containment

Relationship to Other Performing Providers' Projects in the RHP:

Healthcare costs are significantly increased within a patient base with such aggressive chronic conditions that have gone untreated. The initiatives focused to chronic disease management focus to conditions such as asthma, hypertension, and diabetes and are similar in the approach of managing & proactively treating chronic conditions in order to reduce 30-day readmission rates, inappropriate emergency department utilization, and healthcare costs. The Region 3 Initiative grid allows a cross reference of initiatives associated with chronic disease management. (addendum)

Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and successes as well as testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Approach for valuing project:

OBMC values each project based on the specific needs of the community, the projected impact on the health outcomes of the community, the level of advancement to the healthcare delivery system, and the time, effort, and clinical resources necessary to implement each project. We recently hired a Community Health Coordinator to begin the process of compiling the patient information related to the aforementioned patient populations. She be working in partnership with the other community agencies and entities to ensure a successful collaborative effort.

In valuing this project, OBMC took into account the extent to which the implementation of a patient-centered wellness program would potentially meet the goals of the Waiver (support the development of a coordinated care delivery system, improve outcomes while containing costs, improve the healthcare infrastructure), the extent to which it will address the community needs, the population served, and the resources and cost necessary to implement the project.

Rationale/justification for valuation:

The implementation of a patient centered wellness program will promote and encourage patients to access care, and will allow them to more closely follow their treatment plans, which will lead to better clinical outcomes and higher patient satisfaction in the community. OBMC took these potential effects into account when considering the appropriate incentive payment value for this project.

Rice Medical Center

Pass 1

Project Option 2.7.1- Implement innovative evidence-based strategy to increase appropriate use of technology and testing: Expand Use of Immunization Tracking

Unique RHP Project Identification Number: 212060201.2.1
Performing Provider/TPI: Rice/212060201

Project Summary:

Provider: Rice Medical Center is a 25-bed critical access hospital with Trauma IV designation in Eagle Lake, Texas serving an 1100 square mile area and a population of approximately 20,000.

Intervention(s): Rice will implement across-the-board tracking of patients' immunization schedules and completed immunizations in order to avoid duplication and tardiness, and to promote preventative health care.

Need for the project: Rice Medical Center currently reports only on pediatric immunizations. The hospital needs to expand reporting through additional age groups, and can do so through its critical access hospital and rural health clinics in Southern Colorado County and Northern Wharton County. Keeping track of immunizations (including yearly flu and bacterial pneumonia shots) is an especially important endeavor to promote the health of the elderly citizens in Colorado County, who are more susceptible to disease and more likely to have difficulty tracking their immunization history. The RHP 3 Workgroups have identified that the Region as a whole suffers from a lack of immunization compliance, resulting in rising incidence of preventable illnesses such as mumps, measles, pertussis, and tuberculosis.

Target population: Rice Medical Center provides approximately 125,000-130,000 individual patient encounters per year, treating approximately 8,000-10,000 patients, through its hospital and clinic sites. All of these patients will be targeted by this project, and approximately 28-32% are Medicaid-eligible or uninsured.

Category 1 or 2 expected patient benefits: The project seeks to track immunizations for 30% of its patients by the end of DY3, 50% by the end of DY4, and 70% by the end of DY5. This tracking will benefit patients who will enjoy additional protection from duplicative immunizations and assistance in maintaining an appropriate immunization schedule.

Category 3 outcomes: IT-6.1 – Rice seeks to improve patients' satisfaction with their timely access to appointments, care, and information regarding immunizations through providing the ImmTrack service. In DY3, Rice will establish its patients' baseline of satisfaction with their timely access to care, appointments and information. Rice seeks to improve the satisfaction scores by 5% in DY4 and by 10% in DY5.

Project Option 2.7.1- Implement innovative evidence-based strategy to increase appropriate use of technology and testing: Expand Use of Immunization Tracking

Unique RHP Project Identification Number: 212060201.2.1
Performing Provider/TPI: Rice/212060201

Project Description:
Rice will implement across the board tracking of patients' immunization schedules and immunizations received in order to avoid duplication and tardiness, and to promote preventative health care.

Rice Medical Center currently reports only on pediatric immunizations. The hospital needs to expand reporting through additional age groups, and can do so through its critical access hospital and rural health clinics in Southern Colorado County and Northern Wharton County. Keeping track of immunizations (including yearly flu and bacterial pneumonia shots) is an especially important endeavor to promote the health of the elderly citizens in Colorado County, who are more susceptible to disease and more likely to have difficulty tracking their immunization history.

Goals and Relationship to Regional Goals:

While the Region has many specific objectives and improvement targets based on stakeholder input and community needs assessments, the over-arching goals that have guided many of our decisions include the following:
Project Goals:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.
- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system, and
- Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes.

Challenges:

Rice expects challenges in the following areas: (1) training providers to use the ImmTrack technology to track the immunization history and schedule for all patients visiting the hospital or its clinics; (2) educating patients about the benefits of maintaining a punctual immunization schedule; and (3) obtaining an accurate baseline history from patients; and the ability of computer systems to dependably collect and report.

Rice will confront these challenges by organizing comprehensive training session for providers before the program is in place. Rice's providers will communicate with clients about the benefits of this program, and the hospital may use social media forums to reach out to community members who may not visit the hospital or clinics. Rice will attempt to gather the most accurate information available, and the program will only become more successful as the years go by and the data is more accurate.

5-year Expected Outcome for Provider and Patients:
Rice expects to have 70% of its patients seen in the ImmTrack system, enabling Rice to avoid duplication and to inform patients when they are due for updated shots. Increased reporting will allow Rice Medical Center to provide better quality treatment to patients because physicians will have access to reliable information about the patients' medical history, and will be able to identify patients who are overdue for immunizations.

Starting Point/Baseline:
Rice Medical Center currently reports only on pediatric immunizations.

Rationale:
Rice Medical Center currently reports only on pediatric immunizations. The expansion of this reporting will allow the hospital to manage patients' immunization needs in a coordinated manner. This is important for several reasons: Colorado County has a high morbidity rate, some of which is likely attributable to flu and pneumonia infections that could be prevented by immunizations (as well as other conditions); and, Colorado County has a high rate of premature death, at least some of which is likely related to infections that can be prevented by maintaining regularly scheduled immunizations. Additionally, the RHP 3 Workgroups have identified that the Region as a whole suffers from a Lack of immunization compliance, resulting in rising incidence of preventable illnesses such as:

- Mumps
- Measles
- Pertussis
- Tuberculosis

Project Components:
With the development of the Disease Management Registry: Expand use of immunization tracking Project we propose to meet the required project component 2.7.1 - Implement innovative evidence-based strategy to increase appropriate use of technology and testing

Milestones & Metrics:
Process milestones and metrics: P-2 (P-2.1)
Improvement milestones and metrics: I-5 (I-5.1)
Unique community needs identification numbers the project addresses:
Ties to unique community needs: CN.1, CN.6, CN.7, CN.10, CN.17, CN.19

Related Category 3 Outcome Measure(s):

OD 6, IT 6.1(1) Rice selected this outcome because expanding the use of the ImmTrack system will allow the hospital to reach out to patients with immunization reminders (e.g. beginning of

flu season) and assure that they are scheduled for timely appointments and shots when due. This service to patients is intended to increase their satisfaction with Rice's healthcare delivery, and the survey given to patients in the registry should support patients' increased satisfaction with the program.

Relationship to other Projects:
This project relates to the following projects: Reduce Inappropriate Use of the ED and Establish the Wallis Clinic. These projects will work in tandem to improve the system's ability to track patients and assist patients in managing their needed immunizations.

Relationship to Other Performing Providers' Projects in the RHP:

The sheer volume of population as well as the complexity of patient conditions dictate the need of numerous disease registries in our region to properly identify and manage chronic conditions. The concept is utilized consistently throughout our region in order to help achieve milestones and outcomes specific to patient conditions. All disease registries presented have a similarity in concept but are unique in the sense of condition or patient population focus. The Region 3 initiative grid in the addendum reflects direct relations between all projects.

Plan for Learning Collaborative*:*

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The valuation of each Rice project takes into account the degree to which the project accomplishes the triple-aim of the Waiver, community needs, the population served by the project (both number of people and complexity of patient needs), and investment required to implement the project. This project's value derives from the fact that it will reach almost all of Rice's patients (and its clinics' patients) and constitutes preventative care aimed at reducing acute episodes of disease-related symptoms. The project is valued lower than Rice's other projects because it will take less time and investment to implement than some other projects, and the cost is expected to be lower. However, Rice believes this project meets patients' needs, and has value for the Region in preventing the spread of disease and related hospital admissions, and improving patient's ongoing quality of life.

Project Option: 2.2.2 - Apply Evidence Based Care Management Model to Patients Identified as Having High Risk Health Needs: Chronic Disease Outreach

Unique RHP Project Identification Number: 212060201.2.2
Performing Provider/TPI: Rice/212060201

Project Summary:

Provider: Rice Medical Center is a 25-bed critical access hospital with Trauma IV designation in Eagle Lake, Texas serving an 1100 square mile area and a population of approximately 20,000.

Intervention(s): Rice will partner with the Colorado County Health Department and other local stakeholders to provide an organized, systematic approach to chronic disease outreach, reduction, and management using the Care Management Model. Specifically, Rice will identify patients with conditions or health statuses that place them at high risk for hospitalization, acute episodes, diminished quality of life, and long-term interventions (i.e. reduction in ADLs, inability to live independently, progression of the disease at a fast pace). Rice is already aware that diabetes is a prevalent condition within Region 3 and Colorado County, so the care management model will be implemented for those patients. Other potential targets will be patients with hypertension, heart disease, COPD, or other conditions identified as prevalent and placing patients at risk for costly and invasive health care interventions.

Need for the project: Colorado County has a high rate of obesity (29%) and physical inactivity (31%), both of which are linked to chronic diseases such as diabetes and hypertension. Colorado County has a higher rate of poor physical and mental health days, as well as a significantly higher rate of premature death and mortality, than both Harris County and the statewide average (again, which are at least partially linked to chronic disease). This project seeks to bridge the gap in care for the members of the population who are included in these statistics and likely suffer from chronic conditions.

Target population: The target population of this project includes the approximately 2,500-3,500 diabetic patients Rice (and its clinics) treats each year. The target will also include frequent flyers in Rice's ED, wherein approximately 40-50% of the patient conditions are deemed non-emergent. Finally, patients with a history of PPAs and PPRs will be targeted. Rice's rate of PPAs linked to diabetes, COPD, and hypertension is approximately 20%, and the leading condition linked to PPRs is COPD.

Category 1 or 2 expected patient benefits: Rice will identify three prevalent chronic diseases to target using the Care Management Model and implement the program for the targeted conditions by the end of DY3. In DY4, Rice will increase the number of targeted patients participating in care management by 25% over DY3, and by 50% over DY3 by the end of DY5.

Category 3 outcomes: IT-10.1 – Through this project, Rice seeks to improve the quality of life scores for Rice patients participating in the Care Management program by 5% in DY4 over the baseline established in DY3, and by 10% in DY5.

Project Option: 2.2.2 - Apply Evidence Based Care Management Model to Patients Identified as Having High Risk Health Needs: Chronic Disease Outreach

Unique RHP Project Identification Number: 212060201.2.2
Performing Provider/TPI: Rice/212060201

Project Description:
Rice proposes to provide a systematic approach to chronic disease outreach, reduction, and management.

Rice will partner with the Colorado County Health Department and other stakeholders to provide an organized, systematic approach to chronic disease outreach, reduction, and management. Patient education, follow-up, and management will result in better overall health outcomes for the targeted population, including increased quality of life, reduced use of acute care, and slower progression of chronic disease. Developing an effective outreach program that educates patients to the benefits of preventative and management practices; providing and training staff.

Specifically, Rice will identify patients with conditions or health statuses that place them at high risk for hospitalization, acute episodes, diminished quality of life, and long-term interventions (i.e. reduction in ADLs, inability to live independently, progression of the disease at a fast pace). Rice is already aware that diabetes is a prevalent issue in the State and within Region 3 and Colorado County, so the care management model will be used for those patients. Other potential targets will be patients with hypertension, heart disease, COPD, or other conditions identified as prevalent and placing patients at risk for costly and invasive health care interventions.

Goals and Relationship to Regional Goals:
The goal of this project is to develop and partner with the Colorado County Health Department and implement chronic disease management interventions that are geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization.

While the Region has many specific objectives and improvement targets based on stakeholder input and community needs assessments, the over-arching goals that have guided many of our decisions include the following:
Project Goals:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.
- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system, and

- Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes.

Challenges:
Expected challenges include recruiting staff for the clinic, negotiating space for the clinic, reaching out to traditionally underserved communities, engaging in effective patient education, and doing so with limited resources. To address these challenges, Rice will work closely with the community to develop a plan to address these concerns and seek guidance from local resources including providers, associations, and other stakeholders to ensure we implement and provide the most effective process for positive outcomes for our community. We will create an organized, comprehensive program for reaching out to the target populations in Colorado County and coordinating their care to include medication management, lifestyle education, support, and health status monitoring.

5 Year Expected Outcome for Provider and Patients:
By developing an effective outreach program that educates patients about their chronic conditions and the benefits of preventative and management practices we expect to see a significant number of patients receiving care under our Chronic Care Model and by DY 5 expect to see a 50% increase (over the baseline) of the target population receiving care under this model. Through our comprehensive care coordination and ongoing management of the target population we also expect to see patients with improved symptoms and function which are two essential components of health-related quality of life.

Starting Point/Baseline:
Residents within the Rice Hospital District experience a high rate of diabetes, COPD and hypertension. Rice will establish a baseline in DYs 2 and 3 to determine the most prevalent and/or underserved chronic disease for which the greatest impact can be realized in DYs 4 and 5.

Rationale:
Because Rice does not currently have an organized, systematic approach to chronic disease outreach, reduction, and management, at-risk patients in the community often receive little to no professional support. Colorado County has a high rate of obesity (29%) and physical inactivity (31%), both of which are linked to chronic diseases such as diabetes and hypertension. Colorado County has a higher rate of poor physical and mental health days, as well as a significantly higher rate of premature death and mortality, than both Harris County and the statewide average (again, which are at least partially linked to chronic disease). This project seeks to bridge the gap in care for the members of the population who make up these statistics and likely suffer from common chronic conditions.

Project Components:
This project will address the core requirement of this project option which is to apply evidence-based care management model to patients identified as having high-risk health care needs.

Milestones and Metrics:
The following milestones and metrics were chosen for the chronic disease outreach project based on the requirements and the needs of this target population:
Process Milestones and Metrics: P-X (P-X.1); P-3 (P-3.1)
Improvement Milestones and Metrics: I-17 (I-17.1)

Unique community needs identification numbers:
Ties to unique Region community needs: CN.1, CN.7, CN.9, CN.10, CN.20, CN.23, CN.24

Related Category 3 Outcome Measure(s):
OD-10 Quality of Life/Functional Status, IT 10.1 Quality of Life – demonstrate improvement in quality of life scores, as measured by evidence based and validated assessment tool for the target population. Rice chose this outcome measure (improvement target) because the purpose of the outreach is to assist patients with chronic disease to maintain their health and well-being by managing their condition, which ties directly into their ongoing quality of life.

Relationship to other Projects:
This project is related to the FP/OB project, the Diabetes Center project, and the Reducing Inappropriate Use of the ED project. These initiatives are intended to work in tandem to create better patient outcomes for local residents suffering from chronic disease who do not have adequate access to primary care.

Relationship to Other Performing Providers' Projects in the RHP:

Healthcare costs are significantly increased within a patient base with such aggressive chronic conditions that have gone untreated. The initiatives focused to chronic disease management focus to conditions such as asthma, hypertension, and diabetes and are similar in the approach of managing & proactively treating chronic conditions in order to reduce 30-day readmission rates, inappropriate emergency department utilization, and healthcare costs. The Region 3 Initiative grid allows a cross reference of initiatives associated with chronic disease management. (addendum)

Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The valuation of each Rice project takes into account the degree to which the project accomplishes the triple-aim of the Waiver, community needs, the population served by the project (both number of people and complexity of patient needs), and investment required to implement the project. Chronic disease management is essential to improving the short- and long-term health outcomes for Colorado County's residents, and for reducing the cost of health

care delivery in the Region. Chronic diseases such as diabetes, hypertension, COPD, and heart disease are fairly prevalent around Texas, and this will likely be the case for Rice's catchment area. Thus, the project will touch a broad base of the surrounding population. The project will take initial investment to create the parameters and identify the target population, and afterward to maintain communication with patients to manage their conditions and medication.

212060201.2.2	***2.2.2***	***N/A***	***CHRONIC DISEASE OUTREACH***

Project Option 2.6.2 - Establish self-management programs and wellness using evidence-based designs

Unique RHP Project identification number: 212060201.2.3
Performing Provider/TPI: Rice/212060201

Project Summary:

Provider: Rice Medical Center is a 25-bed critical access hospital with Trauma IV designation in Eagle Lake, Texas serving an 1100 square mile area and a population of approximately 20,000.

Intervention(s): Rice will develop a Certified Diabetes Teaching Center to educate and assist patients with managing their chronic disease. Rice will provide guidance to at-risk community members to accomplish the goal of prevention and management of diabetes for at-risk patients. Certified Diabetes Teaching Centers promote self-management for diabetic patients to achieve individualized behavioral and treatment goals that optimize health outcomes, which will benefit individual patients and the healthcare delivery system in Region 3.

Need for the project: Currently, the community does not have a certified diabetes teaching center. Residents within the Rice Hospital District currently must travel long distances to urban providers or rely on primary care physicians for specific education related to diabetes management and prevention. A large portion of the population is both unable to travel and does not maintain an established relationship with a primary care physician. Presently, 15% of Colorado County residents receiving primary care are not even screened for diabetes. Nearly 1/3 of adult residents are obese, and 31% of the population engages in physical inactivity, both of which are linked to the onset and exacerbation of diabetes. Finally, the County has a higher rate of preventable hospital stays than the State wide average and Harris County, some of which are related to diabetes.

Target population: Approximately 20% of the patients Rice currently treats in its hospital and local clinics are diagnosed with Type I or II diabetes, and of those patients 40-50% are Medicaid eligible or uninsured. These patients are the direct target population of this project, while patients in the community who are at risk or pre-diabetic are the secondary target of this project.

Category 1 or 2 expected patient benefits: The project seeks create an operational Certified Diabetes Teaching Center, including staff trained in protocols and community outreach, by the end of DY3. In DY 4, Rice intends to measure the number of patients identified with diabetes who are receiving disease-specific interventions through the diabetes center. In DY5, Rice will increase the number of targeted patients receiving disease-specific interventions through the Center by 10% over DY 4's baseline.

Category 3 outcomes: IT-1.10 – Rice seeks to increase the percentage of patients it treats in its hospital and clinics with controlled blood sugar (HbA1c of 9% or lower) by 10% over baseline in DY5.

Project Option 2.6.2 - Establish self-management programs and wellness using evidence-based designs

Unique RHP Project identification number: 212060201.2.3
Performing Provider/TPI: Rice/212060201

Project Description:
Rice will develop and implement a program for diabetic care management support in its primary care clinics.

Rice will develop a Certified Diabetes Teaching Center to educate and assist patients with managing their chronic disease. Rice will provide guidance to at-risk community members to accomplish the goal of prevention and management of diabetes for at-risk patients. Establishing self-management and wellness programs for our targeted population we provide the best opportunity for positive results and ongoing outcomes.

Goals and Relationship to Regional Goals:
While the Region has many specific objectives and improvement targets based on stakeholder input and community needs assessments, the over-arching goals that have guided many of our decisions include the following:
Project Goals:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.
- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system, and
- Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes.

Challenges:
Rice expects challenges as follows: 1) developing a program eligible for certification as a certified teaching center; 2) training and/or acquiring qualified staff to administer the program; and 3) educating patients about the benefits of preventative care. Rice intends to address these challenges by researching best practices and planning effectively to implement a center that will receive certification. As part of developing the plan, Rice will create a timeline and allocate resources for timely training and/or recruiting of staff, so as to coincide with the implementation of the center. Finally, Rice will engage stakeholders in reaching out to the at-risk community by using innovative methods, such as social media, provider outreach, or other community messaging forums.

5-Year Expected Outcome for Provider and Patients:
Rice expects a high rate of prevention of the onset of Type II diabetes for targeted pre-diabetics in the community through provider-furnished education and management about lifestyle choices, medications, and risks. Additionally, Rice expects a higher rate of controlled diabetes among community members with the chronic disease.

Starting Point/Baseline:
The current community does not have a certified diabetes teaching center. Residents within the Rice Hospital District currently must travel long distances or rely on primary care physicians for specific education related to diabetes management and prevention. A large portion of the population is both unable to travel and do not maintain an established relationship with a primary care physician.

Rationale:
Colorado County residents will benefit from primary care providers educating at-risk patients on how to prevent the onset of Type II Diabetes and providing disease management best-practices to those suffering from diabetes already. The prevalence of diabetes increases annually around the State, and this project will further address Colorado County's rate of premature death and poor physical health days, which exceed the statewide rate.

Specifically, 15% of Colorado County residents receiving care are not being screened for diabetes. Nearly 1/3 of adult residents are obese, and 31% of the population engages in physical inactivity, both of which are linked to the onset and exacerbation of diabetes. Finally, the County has a higher rate of preventable hospital stays than the State wide average and Harris County, some of which are related to diabetes.

Project Components:
This project will address the core requirement of this project option which is to establish self-management programs and wellness using evidenced-based designs.

Milestones and Metrics:
The following milestones and metrics were chosen for the Rice Certified Diabetes Teaching Center project based on the core component and the needs of the target population:
Process Milestones: P-1 (P-1.1); P-3 (P-3.1)
Improvement Milestones: I-6 (I-6.1); I-8 (I-8.1)
Unique community needs assessment numbers:
CN.1, CN.4, CN.10, & CN.12.

Related Category 3 Outcome Measure(s):
OD-1 Primary Care and Chronic Disease Management, IT-1.10 Diabetes care: HbA1c poor control (>9.0%)
Reasons/rationale for selection the outcome measures:
Rice chose this Category 3 Outcome because one of the goals of the Certified Diabetes Teaching Center is to assist patients in managing this chronic disease. When a diabetic's blood sugar is properly and regularly managed, the risk of being admitted to the hospital for diabetes related complications is reduced greatly. For example, when patients manage their glucose levels

they are able to reduce micro-vascular and neuropathic complications of type 1 and type 2 diabetes.

Avoiding the hospital stays and other potential consequences of uncontrolled blood sugar (blindness, amputation, etc) is both beneficial for patient short- and long-term health outcomes (less exposure to infection and hospital-based complications, as well as invasive interventions for the related health consequences), and beneficial for the health care delivery system by reducing costs.

Relationship to other Projects:
This project is related to the following Rice projects: Chronic Disease Outreach, establishing the Wallis Clinic and Reducing Inappropriate use of the ED. These projects will work in tandem, creating a comprehensive approach to managing diabetes.

Relationship to Other Performing Providers' Projects in the RHP:
Healthcare treatment cannot focus to only the acute or chronic encounter and properly treat the patient. It is critical that our region focuses to patient education and community education to ensure a proactive and responsive approach to healthcare needs. The education models represented in the Region 3 RHP plan can be identified in the Initiative Grid (addendum) and all focus to outcome measures such as appropriate utilization, patient satisfaction scores, and standalone chronic condition scores such as diabetes and asthma.

Plan for Learning Collaborative:
We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:
The valuation of each Rice project takes into account the degree to which the project accomplishes the triple-aim of the Waiver, community needs, the population served by the project (both number of people and complexity of patient needs), and investment required to implement the project. Rice valued this project based on the following considerations:

1. Managing chronic disease prior to the onset of acute or emergent conditions is a patient-centered and cost-centered goal under the Waiver, which this project will address head-on by providing early intervention, patient education, and provider monitoring of this chronic disease.
2. Due to the County's high rate of obesity and physical activity, there are likely many patients suffering from pre-diabetes or uncontrolled diabetes. Rice needs to first identify these patients (which will mean providing screening to all patients, and engaging new patients to visit the Center for screening). Rice then needs to determine how to have the maximum impact on the lifestyle choices made by the Center's patients by using innovative and evidence-based methods for communicating with and monitoring patient success at preventing and/or controlling the condition.

3. Implementing the Center will require a great deal of investment. Specifically, staff time will need to be dedicated to planning and implementing the development of the Center, seeking Certification, and operating the Center. Rice will need to identify space and start-up costs, as well as ways to engage stakeholders in the community (providers, patients, social groups).

212060201.2.3	**2.6.2**	*N/A*	***Implement Evidence-based Health Promotion Programs - Certified Diabetes Teaching Center***
Rice			*212060201*

(Rice will increase the target diabetic and pre-diabetic population of Colorado County reached by the center by 10% over the baseline.) Metric 1 [I-8.1]: Increase percentage of target population reached by the project in Colorado County. Baseline: TBD Data Source: Patient records, other documentation showing targeted population versus those seen at the Center Milestone 4 Estimated Incentive Payment: $33,548
Year 2 Estimated Milestone Bundle Amount: $37,117	Year 3 Estimated Milestone Bundle Amount: $40,493	Year 4 Estimated Milestone Bundle Amount: $40,611	Year 5 Estimated Milestone Bundle Amount: $33,548
TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD *(add milestone bundle amounts over Years 2-5):* $151,769			

Spindletop Center

Pass 1

Project Option 2.15.2 - Integrate primary and behavioral healthcare services: design, implement and evaluate projects that provide integrated primary and behavioral health care services
Unique RHP Project Identification Number: 096166602.2.1
Performing Provider Name/TPI: Spindletop Center / 096166602

Project Summary:

Provider: Spindletop Center is a public entity community that provides services for approximately 2900 adult, child, and adolescent behavioral health clients, With locations in Beaumont, Orange, Port Arthur, Lumberton, and Silsbee, Spindletop serves a population of more than 400,000 in Jefferson, Orange, Hardin, and Chambers counties.

Intervention: Spindletop will co-locate primary care clinics in its buildings to facilitate coordination of primary and behavioral healthcare. A mobile clinic will be acquired to provide physical and behavioral health services for our clients in locations other than existing Spindletop clinics. Spindletop will also implement Individualized Self Health Action Plan for Empowerment ("In SHAPE"), a wellness program for individuals with mental illness.

Need for project: The Region Community Needs Assessment has identified the need for expanded physical health care. Many behavioral health clients cannot access physical health care because they are uninsured or indigent. Health clinics that serve indigent populations often cannot accept more patients and charge a fee higher than many clients can pay. Some of our behavioral health clients have difficulty arranging transportation for multiple healthcare visits.

Target Population: This project is targeted to the 2200 adult mental health clients Spindletop serves. Since 54% of these are Medicaid clients and most of the others are uninsured indigent, almost all of the individuals who participate in this program will be either indigent or enrolled in Medicaid.

Expected benefits: By integrating primary care with Spindletop's behavioral services, 1500 behavioral health clients per year will have open access to outpatient physical health care and appropriate referrals by the end of DY 5, resulting in improved quality of life and reducing emergency room visits and hospitalizations. For DY 2, the process milestone is to develop the integrated sites as reflected in the number of locations and providers participating in the integration project. In demonstration years 3-5, the improvement milestones will be the number of primary care appointments available.

Category 3 outcomes: Spindletop has selected improvement outcome measure OD-6 Patient Satisfaction, IT-6.1, percent improvement over baseline of patient satisfaction scores, (1) patients are getting timely care, appointments, and information. The client survey will be designed to produce comparable data on the client's perspective on care that will allow objective and meaningful assessment of the program in meeting the needs of the clients.

Project Option 2.15.2 - Integrate primary and behavioral healthcare services: design, implement and evaluate projects that provide integrated primary and behavioral health care services

Unique RHP Project Identification Number: 096166602.2.1
Performing Provider Name/TPI: Spindletop Center / 096166602

Project Description:
This project will integrate primary care with the behavioral health care services Spindletop Center ("Spindletop") provides in order to improve care and access to needed health services for the clients we serve.

Spindletop will co-locate primary care clinics in its existing buildings to facilitate coordination of healthcare visits and communication of information among healthcare providers. In addition, a mobile clinic will be purchased or leased and equipped to provide physical and behavioral health services for our clients in locations other than existing Spindletop clinics. The mobile clinic could also be used to provide physical and behavioral health services during disasters such as hurricanes.

To supplement the benefits of integrating primary care with behavioral health services, Spindletop will implement Individualized Self Health Action Plan for Empowerment ("In SHAPE"), a wellness program for individuals with mental illness. Clients will receive proactive, ongoing care that keeps them healthy and empowers them to self-manage their conditions in order to avoid their health worsening and needing ED or inpatient care.

Goals and Relationship to Regional Goals:
This project relates to the Region 3 goal of improving the health of our region by expanding and coordinating access to patient-centered primary care and behavioral health care services that includes health promotion and disease prevention.

Challenges:
Although Spindletop currently provides basic care such as labs and screenings for drugs, pregnancy, glucose and lipid profiles, we have not expanded other physical health care services due to funding limitations. Hiring or contracting for primary care providers may be challenging as well. Spindletop will initially use one of its current physicians to provide primary care two days a week in addition to the behavioral health services she provides.

5-Year Expected Outcome for Provider and Patients:
By integrating primary care with Spindletop's behavioral services, 1500 behavioral health clients per year will have open access to outpatient physical health care and appropriate referrals by the end of demonstration year 5. We will begin the project by providing primary health care two days a week in DY3 and add another day each year, resulting in primary care services offered four days per week by year 5. Note that these outcomes are for both Regions 2 and 3 since this project spans these two areas.

Addressing the physical health needs of clients will result in improved quality of life for these clients as well as reducing emergency room visits and hospitalizations for more severe illnesses and diseases that occur when physical health is neglected.

Starting Point/Baseline:
Spindletop Center currently provides behavioral health services for primarily indigent or Medicaid-eligible clients who have schizophrenia, bipolar disorder, and major depression. We have space in our existing facilities to co-locate primary care providers. A need has been identified to provide primary care for our clients in the same location that they receive behavioral health services. Scheduling, billing, and electronic health records systems are already in place for our clients and could be adapted for integration with primary care services.
Rationale:
Behavioral health clients have a high incidence of high blood pressure, cholesterol, obesity, diabetes, and other severe illnesses that shorten their life spans by 25 years compared to the general public. They are frequently high utilizers of hospital emergency departments because they do not have access to regular physical health care.

The Region 3 Community Needs Assessment has identified the need for expanded and integrated physical and behavioral health care. Spindletop Center has determined that many of our behavioral health clients do not have access to physical health care because they are uninsured or lack funds to pay for these services. Health clinics that serve indigent populations frequently do not have capacity to accept more patients and charge a fee higher than many clients are able or willing to pay. Some of our behavioral health clients have difficulty arranging transportation for multiple healthcare visits. Co-locating primary care providers in our behavioral health facilities, providing a mobile clinic, and coordinating healthcare appointments will increase the likelihood that our clients will receive the physical health care they need.

The primary care/behavioral health integration proposed in this plan relates to community needs CN.1, CN.2, CN.5, and CN.10.

This project represents a new initiative for Spindletop. No U.S. Department of Health and Human Services funding is received for this program.

Project Components:
Components of the project include the following:
- Facilities will be adapted for co-locating primary care services.
- A mobile clinic will be purchased and equipped to provide primary and behavioral health care.
- Medical professionals and support staff will be hired or contracted to provide the primary care services.
- InSHAPE health mentors will be hired and trained to work one-on-one with behavioral health clients for education, planning, coaching, and measuring progress.
- For the InSHAPE program Spindletop will partner with local wellness and fitness centers to help behavioral health clients navigate the available opportunities to improve their health condition.
- Protocols will be established for joint scheduling, shared information and treatment plans, and referrals.
- Spindletop's existing electronic health record system will either be expanded to accommodate physical health data if primary care providers are hired as employees or will be integrated with outside systems if contracted providers are utilized for primary care.
- Spindletop's current medical staff meetings will be expanded to include primary care providers and discussions of primary care issues at least monthly.

- A system of reporting primary care utilization and outcomes will be developed.
- Ongoing quality assessments will be done to provide feedback for impact and improvements.

Milestones & Metrics:
For demonstration year 2, the process milestone is to develop the integrated sites as reflected in the number of locations and providers participating in the integration project.

In demonstration years 3-5, the improvement milestones will be the number of primary care appointments available. Adding 500 appointments each year will increase the number of available appointments to 1500 by the end of demonstration year 5. The number of additional appointments is for both Regions 2 and 3.

Related Category 3 Outcome Measure(s):
Spindletop has selected improvement outcome measure IT-6.1, percent improvement over baseline of patient satisfaction scores, (1) patients are getting timely care, appointments, and information. Since the goal of this project is to provide expanded primary care for our behavioral health clients, measuring the availability and timeliness of physical health care and appointments that meet clients' needs is important. If clients are satisfied with the service, they will be more likely to access primary care that will lead to improved physical health.

Relationship to Other Projects and Measures:
This project relates to Spindletop's Region 2 project to enhance behavioral health training #096166602.2.4 as techniques implemented in that plan may be applied to this program. The project to provide specialty behavioral health care #096166602.1.1 is also related as more clients could receive primary care as well; although this is a Region 2 project, it will also expand care in Region 3

Relationship to Other Performing Providers' Projects and Measures:
Other providers in the region are expanding behavioral health capacity and integrating behavioral and physical health. Spindletop's project will complement those activities.

The cohabitation of primary care and behavioral health is an important focus of our region in order to treat the patient base with comprehensive physical and behavioral healthcare issues. There are multiple initiatives in our RHP plan that address this need and all can be found on the Region 3 Initiative Grid in the addendums. The outcome measures focused to screening measures and access of the patient base.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's healthcare system.

Project Valuation:
Spindletop considered several factors in valuing this project including reductions in costs associated with emergency room visits and hospitalizations for diseases and illnesses. Improving the physical health of behavioral health clients should reduce the number of ED visits and the occurrences of hospitalizations. The average cost of an ED visit in Spindletop's area is $1,265; average cost of a cardiology-related hospital stay is about $16,000.

Another valuation factor used for this project is the monetary value for a collaborative primary/behavioral health intervention as measured by quality adjusted life-years multiplied by a life year value. This valuation methodology uses health economic studies to assign a life year value associated with the health intervention. Since behavioral health clients have a high incidence of severe illnesses that shorten their life spans by 25 years compared to the general public, any programs that improve their mental and physical health should increase both the length and quality of their lives.

St. Joseph Medical Center

Pass 1

Project Option: 2.17.1 – Design, implement, and evaluate interventions to improve care transitions from the inpatient setting for individuals with mental health and/or substance abuse disorders: Partial Hospitalization Program

Unique RHP Project Identification Number: 181706601.2.1
Performing Provider Name/TPI: St. Joseph Medical Center/181706601

Project Description:
St. Joseph Medical Center proposes to expand services to individuals that have a mental health and/or substance abuse disorder through a Partial Hospitalization Program.
Provider:
St. Joseph Hospital is a 792 licensed facility. Located in the heart of downtown Houston, St. Joseph's Hospital has provided medical and psychiatric care to Houstonians for 125 years.

Volume Statistics - FY2012	Patient Payer Mix: Overall Hospital (%)	Patient Payer Mix: Psychiatry (%)	Patient Demographics (%)
ER visits- 29,155 Emergency visits- 173,263 Behavioral Health Admissions - 3,518 Med-surg admits – 7049	1.18 - Commercial 18.76- Managed Care 19.28- Managed Medicaid 16.34- Managed Medicare 15.09- Medicaid 20.78- Medicare 8.37 - Charity	2.27- Commercial 8.77- Managed Care 18.40- Managed Medicaid 3.05 - Managed Medicare 10.41 - Medicaid 35.61 - Medicare 21.48 - Charity	Caucasion – 33.47 Black – 37.59 Hispanic – 11.51 Asian - .44 American Indian/Native American - .38 Unknown – 13.24 Other – 3.34

Intervention(s):
In this program we will only take voluntary patients and patients must agree to the program rules. All patients are seen by a psychiatrist, psychiatric residents and a RN. They attend four "core" groups per day ran by a licensed therapist. The program runs from the hours of 9:00 to 3:00 and a small breakfast, lunch and snacks are provided.
Need for the project:
Within the Houston community, there are several similar programs servicing the outlying areas. Few programs of this sort assist those clients in or around the Downtown community. Many shelters and low-income type agencies are housed in and around St Joseph's Hospital.
Target Population:
The program will serve both clients discharging from the inpatient unit and also clients coming from outside referral sources.
Category 1 or 2 expected patient benefits:
Our goal is to provide the "best" model for the patients in this program (typically lower functioning individuals with a GAF below 40). To do this, we are investigating the best evidence-based models and implementing a model within the next 6 months.
Related Category 3 Outcome Measure(s):
OD-1 Primary Care and Disease Management
IT-1.18 Follow Up After Hospitalization for Mental Illness

Project Option: 2.17.1 – Design, implement and evaluate interventions to improve care transitions from the mental health and/or substance abuse disorder

Unique RHP Project Identification Number: 181706601.2.1

Performing Provider Name/TPI: St Joseph Medical Center/181706601

Project Description:

St. Joseph Medical Center proposes to expand services to individuals that have a mental health and/or substance abuse disorder through a Partial Hospitalization Program.

The plan and goal for this program is to expand services within the community for the Partial Hospitalization Program at St. Joseph Medical Center. Many times, clients who are functioning at or below a GAF of 40 (CMS recommendation for this level of care) do not follow through with their care recommendations including; medication compliance, living situation stability, therapy and aftercare needs. This in turn results in a high level of recidivism and/or re-admissions that having a partial program helps correct.

Through the ongoing efforts of wrap-around services such as a PHP, clients are able to attend groups, maintain and be monitored with their medication compliance and have support in communication with their current residential setting. To enhance compliance, transportation is provided to/from the patient's residence.

Many patients in the PHP programs are participants in medicare programs and are unable to remain compliant with their care post inpatient care. Many underinsured in the Houston area (Medicaid HMO) are unable to access care and become non-compliant with their medications and over utilize inpatient care. It is believed that with a collaborative effort with MHMRA, these patients could have their needs met better through a Partial program that ensures compliance by monitoring them daily (Monday-Friday) and ensuring they participate in the program by providing transportation to this vulnerable population.

Each patient in the PHP is initially evaluated to determine if they are appropriate and willing to be compliant with the program- therefore, in this program we only take voluntary patients and they must agree to the program rules. All patients are seen by a psychiatrist, psychiatric residents and a RN. They attend four "core" groups per day ran by a licensed therapist. The program runs from the hours of 9:00 to 3:00 and a small breakfast, lunch and snacks are provided.

Goals and Relationship to Regional Goals:

Project Goals:

- Expand PHP services to individuals in the Houston metro area
- Expand Transportation to/from the PHP for those patients requiring care from our PHP

- Collaborate with other area agencies to provide services for their clients and offer better wrap-around services to meet the needs within the community
- Increase the percentage of patients who were hospitalized for treatment of selected mental health disorders and who had an outpatient visit, an intensive outpatient encounter or partial hospitalization with a mental health practitioner. Rate reported will be those patients with follow up visits within 30 days of discharge.
-

This project meets the following Region 3 goals:

Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes.

Challenges:

1. Locating, hiring and training staff appropriate for the PHP (RN's, therapists and Techs)

2. Higher level of scrutiny on all levels of PHP due to multiple concerns with other providers which will require the Director be involved in and attending semi-annual conferences on compliance and regulatory concerns.

3. Physician coverage issue may be an issue for any off site locations

The facility will address these challenges by:

1. Work through Human Resources to advertise, identify and help in the hiring/training portion of these issues.
2. Attendance at the semi-annual conferences on compliance and regulatory concerns held by the state. Additionally, an internal auditor will assist with ensuring compliance through regular chart and programmatic audits.
3. Facility will identify community practitioners willing to provide physician coverage and partner with the facility.

5-Year Expected Outcome for Performing Provider and Patients:

-Patient expansion will reach 50 ADC (Average Daily Census) through a gradual ramp-up
-Patients will participate in evidence-based programming
-Ongoing feedback from both the patients and community partners will help determine best practices and consistent re-evaluation of the program will occur

Starting Point/Baseline:

-We currently have one van which is operational providing transportation to the clients within the program
-Staffing currently includes one full time RN, one full-time therapist, one tech/driver along with a working manager
-Current Average Daily Census is: 5

Rationale:

Many of the clients identified as needing this service are currently being readmitted to the facility for inpatient care on a regular basis. The goal of this program is to decrease recidivism; increase compliance to discharge plans and help ensure the patient is more functional in an outpatient setting. Most clients admitted to a partial program have a GAF (global assessment of functioning – as noted in the DSM4 Manual) of 40 or below. Typically, this means that they have poor psycho-social skills and low compliance to discharge plans and poor follow through with their medication regimen.

Project Components:

Through the Partial Hospitalization Program, we propose to meet all required project components listed below and believe that the selected milestones and metrics relate to project components.

a) Develop a cross-continuum team comprised of clinical and administrative representatives from acute care, ambulatory care, behavioral health and community-based non-medical supports
b) Conduct an analysis of the key drivers of 30-day hospital readmissions for behavioral health conditions using a chart review tool and patient and provider interviews.
c) Identify baseline mental health and substance abuse conditions at high risk for readmissions
d) Review best practices for improving care transitions form a range of evidence-based or evidence-informed models
e) Identify and prioritize evidence-based strategies and clinical protocols that support seamless care transitions and reduce preventable 30-day readmissions
f) Implement two or more pilot interventions in care transitions targeting one or more patient care units or a defined patient population.
g) Conduct quality improvement for project using methods such as rapid cycle improvement.

Milestones & Metrics:

The following milestones and metrics have been chosen for the Partial Hospitalization Program project based on the needs of the target population:

- Process milestones and Metrics: P-6; P-6.1

Unique community need identification number the project addresses:

- CN-3 – Inadequate access to behavioral health care

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Disease Management

IT-1.18 Follow Up After Hospitalization for Mental Illness – NQF 0576

Project Valuation:

This project has an assigned value of $8,205,536 for the four years starting with DY2 – DY5. Extensive analysis was initiated to derive at this value. Project costs (capital and operational) and community benefits were among the factors used to create the valuation. Modest renovations to an existing space in the Psychiatric building (Cullen Building) must be made to accommodate the expected OP census. Renovation costs are estimated at $250,000 (capital). In addition, a medical director must be paid to care for these patients. Also, clinical staff must be employed to conduct the non-physician care associated with this service line. In addition, a transport van must be purchased to increase our census as this project expects ($40,000 capital estimated).

Project Option: 2.15.1 – Design, implement and evaluate interventions to improve care transitions from the mental health and/or substance abuse disorder

Unique RHP Project Identification Number: 181706601.2.2
Performing Provider Name/TPI: St Joseph Medical Center/181706601
Project Description:
This proposed unit will meet the needs of adults (ages 18 and above) who have a primary medical diagnosis with a co-occurring psychiatric diagnosis. These patients will be treated on a unit specifically designed to meet both diagnosis within the hospital. It will be a separate and distinct unit – comprised of 12 beds.
Provider:
St. Joseph Hospital is a 792 licensed facility. Located in the heart of downtown Houston, St. Joseph's Hospital has provided medical and psychiatric care to Houstonians for 125 years.

Volume Statistics - FY2012	**Patient Payer Mix: Overall Hospital (%)**	**Patient Payer Mix: Psychiatry (%)**	**Patient Demographics (%)**
ER visits- 29,155 Emergency visits- 173,263 Behavioral Health Admissions - 3,518 Med-surg admits – 7049	1.18 - Commercial 18.76- Managed Care 19.28- Managed Medicaid 16.34- Managed Medicare 15.09- Medicaid 20.78- Medicare 8.37 - Charity	2.27- Commercial 8.77- Managed Care 18.40- Managed Medicaid 3.05 - Managed Medicare 10.41 - Medicaid 35.61 - Medicare 21.48 - Charity	Caucasion – 33.47 Black – 37.59 Hispanic – 11.51 Asian - .44 American Indian/Native American - .38 Unknown – 13.24 Other – 3.34

Intervention(s):
The concept would be to have a strong emphasis on the medical issues while also focusing on the mental health needs of the clients at the same time. This medical psychiatric nursing and support team will be trained in trauma-informed care models and the interface between medical and psychiatric problems.
Need for the project:
Currently, there are two medical-psychiatric units in Houston. There is a unit at Ben Taub and another unit at Memorial Southwest. According to statements both by their own staff and from referrers within the community, these units stay consistently full.
Target Population:
All eligible patients within the St Joseph Hospital system could benefit from this program.
Category 1 or 2 expected patient benefits:
Our goal is to provide the "best" model for co-occurring diagnosis –which will include investigating the best evidence-based models and implementing the one selected. We will hire and train staff interested in working with individuals with co-occurring diagnosis and also select and pay a psychiatrist to attend to these clients.
Related Category 3 Outcome Measure(s):

OD-9 Right Care, Right Setting, IT-9.4 Other Outcome Improvement Target – our goal is to set up Quality indicators, similar to those used by most managed care companies. They will be established to determine a 3-month outcome post discharge from patients leaving this program.

Project Area: 1.9 Expand Specialty Care Capacity

1.9.3 "Other" project option: Implement other evidence-based project to expand specialty care capacity in an innovative manner not described in the project options above. Providers implementing an innovative, evidence-based project using the "Other" project option may select among the process and improvement milestones specified in this project area or may include one or more customizable process milestone(s) P-X and/or improvement milestone(s) I-X, as appropriate for their project. Milestone I-33 includes suggestions for improvement metrics to use with this innovative project option.

Unique RHP Project Identification Number: 181706601.2.2

Performing Provider Name/TPI: St Joseph Medical Center/181706601

Project Description:

Numerous studies have demonstrated the high prevalence of co-occurring mental health and medical issues in the United States. Due to a severe shortage of inpatient programs which are able to address these co-occurring needs, typically one of two things occurs in the Houston market.

1. The patient is treated for their medical condition and their mental health concerns go largely unaddressed or they are placed in a medical bed with a "sitter" to ensure their safety while also decreasing risk and liability. Once again, this does not address those mental health issues or needs but instead, their treatment is merely delayed.
2. The patient is unable to access care for their mental health issues as their co-occurring medical issues are part of an exclusionary criteria in most free-standing psychiatric hospitals.

Currently, there are two medical-psychiatric units in Houston. There is the unit at Ben Taub and another unit at Memorial Southwest. According to statements both by their own staff and from referrers within the community, these units stay consistently full and it is virtually impossible to get a patient from another facility to either one of these units.

This proposed unit will meet the needs of adults (ages 18 and above) who have a primary medical diagnosis with a co-occurring psychiatric diagnosis. The patients will be screened and admitted by a unit manager, who will either be a Licensed Clinical Social Worker or RN. The unit manager will report to the psychiatric director and manage the daily milieu. The unit will be staffed to include two psychiatric social workers who will conduct the therapeutic interventions and make the discharge plans in collaboration with the attending physician.

The concept would be to have a strong emphasis on the medical issues while also focusing on the mental health needs of the clients at the same time. This medical psychiatric nursing and support team will be trained in trauma-informed care models and the interface between medical and psychiatric problems. They will implement best practices to meet the needs of this particular type of clientele. Training of the staff will be highly important in the first year of opening the unit.

Goals and Relationship to Regional Goals:

Project goals:

- Evaluate and determine the "best" model for co-occurring conditions and open a program to meet those needs
- Determine most effective ways to assist patients in their recovery process from both the medical and psychiatric challenges that they face

Relationship to Regional Goals:

- Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes.

5 year expected outcome for Performing Provider and patients:

- Within 5 years, we will have an operational and clinically sound program for the medical-psychiatric patient at St. Joseph's Behavioral. This program will be managed by a skilled clinician who will ensure that all quality, regulatory and productivity goals are met.
- Determine optimal number of beds with a ramp up to financially cover the % of admissions – as specified in the matrix. Community need has already been determined – clearly, there is a severe lack of services in the city for the medical/psychiatric patient. As of the date of this proposal, there is no known other proposals to cover a medical/psychiatric project.
- Complete renovation, advertise and open a 12 bed unit to address the co-occurring needs of the medical and psychiatric patient

Challenges and how addressed:

- Renovation time frames and opening program to meet the needs of these clients
- Determining exclusionary criteria and processes for accepting transfers from other facilities
- Medical staff integration and operational issues
- Locating nursing and clinical staff appropriate for meeting the needs of this population of patients.
- Understanding licensing standards and initiating licensure, forms and policy and procedures for this program.

Ways to be addressed:

- Renovation plans are easily prepared and upon acceptance of this program can proceed forward
- Exclusionary criteria- will be developed in cooperation with the medical staff and a medical director, who will be selected – other examples exist from the other units and can be utilized as a template
- Medical staff integration will take place immediately and with the assistance of an identified medical director
- Human resources at the hospital will assist with the hiring, training and selection of the appropriate staff for this program
- Licensing standards- the compliance and risk departments within the hospital can be called on to assist with all these issues.

Rationale:

Currently, these clients are being admitted to general floors within the hospital and are "blended" into rooms with patients who may/may not have mental health issues. This project will bring all these patients into one area to better meet both their mental health needs and medical needs in a more appropriate integrated setting.

Listed below are some facts regarding co-occurring diagnosis issues. These were taken from several sources and source information can be found through the Mental Health America website. Based upon the literature review seen below, there are clear indicators that there is a strong correlation between medical illnesses and psychiatric diagnosis. With that in mind, it would appear that treatment of these needs in an appropriate setting whereby both issues are addressed concurrently makes sense. This proposal is to treat both issues concurrently in the most appropriate setting. Most free-standing psychiatric facilities do not feel adequately equipped to address the medical issues and in-fact list the medical issues on their exclusionary admitting criteria. This leaves virtually (with the exception of two units) no options for people in the Houston community to go for treatment.

Listed below are some facts regarding co-occurring diagnosis issues. These were taken from several sources and source information can be found through the Mental Health America website. ****Facts about co-occurring medical/psychiatry (reference: Mental Health America)**

-The rate of depression among those with medical illnesses in primary care settings is estimated at five to 10 percent. (2)
- Among those hospitalized, the rate is estimated at 10 to 14 percent. (2)
-The more severe the medical condition, the more likely that patient will experience clinical depression.(2)
-People with depression experience greater distress, an increase in impaired functioning and less ability to follow medical regimens, thus hindering the treatment of any other medical conditions. (2)
-Medical disorders may contribute biologically to depression.[3]
-Unfortunately, the diagnosis of depression is missed 50 percent of the time in primary care settings. (1)
-Depression occurs in 40 to 65 percent of patients who have experienced a heart attack, and in 18 to 20 percent of people who have coronary heart disease, but who have not had a heart attack. (4)
-After a heart attack, patients with clinical depression have a three to four times greater chance of death within the next six months. (4)
-One in four people with cancer also suffers from clinical depression. (8)
-Depression occurs in 10 to 27 percent of stroke survivors and usually lasts about one year. (6)
-An additional 15-40 percent of stroke survivors experience some symptoms of depression within two months after the stroke. (7)
-One in four people with cancer also suffers from clinical depression. (9)
-People with bipolar disorder are also at higher risk for thyroid disease, migraine headaches, heart disease, diabetes, obesity, and other physical illnesses (2)

Project Components:

We propose to meet all of the required project components as follows:

a) Identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community.
b) Develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated.
c) Establish protocols and processes for communication, data-sharing, and referral between behavioral and physical health providers
d) Recruit a number of specialty providers (physical health, mental health, substance abuse, etc. to provide services in the specified locations.
e) Train physical and behavioral health providers in protocols, effective communication and team approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include:
- Regular consultative meetings between physical health and behavioral health practitioners;
- Case conferences on an individualized as-needed basis to discuss individuals served by both types of practitioners; and/or

- Shared treatment plans co-developed by both physical health and behavioral health practitioners.

f) Acquire data reporting, communication and collection tools (equipment) to be used in the integrated setting, which may include an integrated electronic health record system or participation in a health information exchange – depending on the size and scope of the local project.

g) Explore the need for and develop any necessary legal agreements that may be needed in a collaborative practice.

h) Arrange for utilities and building services for these settings

i) Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual treated in these integrated service settings.

j) Conduct quality improvement for project using methods such as rapid cycle improvement.

Unique community needs identification numbers:

CN 3 - Inadequate access to behavioral health care

Related Category 3 Outcome Measure(s):
OD-9 Right Care, Right Setting, IT-9.4 Other Outcome Improvement Target

Reasons/rationale for selecting the outcome measures:

The goal is to ensure that all clients are treated in the most appropriate manner for their co-occurring mental health and medical issues. The measure selected would allow us to track if we are accomplishing this goal.

Relationship to other Projects: The increased access to primary care visits will naturally generate additional need of specialty care visits based on the condition and acuity of the patients served. Understanding that the patient base targeted through this initiative will generate significant specialty care visits due to chronic conditions and lack of previous treatments, this initiative and similar initiatives will focus to 30-day readmission rate reductions, improvement for patient satisfaction scores, and admission rates specific to chronic conditions. Numerous initiatives have been included in the RHP plan and the addendum of the Initiative Grid can directly tie all specialty care projects together by category.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Project is valued at $12,623,903 for the four years starting with DY2 – DY5. Extensive analysis was conducted to arrive at this valuation. Benefits to the community include the increase in available beds in the community to which patients with dual diagnoses (behavioral and medical) can be admitted. This coordinated care in the right setting will reduce readmissions, medical complication rates and overall length of stay, saving the unnecessary burdens of treating these patients.

St. Luke's Episcopal Hospital

Pass 1

Project Option 2.12.1- Develop, implement and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions : Transitional Care for Chronic Disease

Unique RHP Project Identification Number: 127300503.2.1
Performing Provider Name/TPI : St. Luke's Episcopal Hospital/127300503

Project Summary:

Provider:
St. Luke's Episcopal Hospital (SLEH) is a 718-bed tertiary and quaternary teaching hospital located in the heart of the Texas Medical Center and is home of the Texas Heart® Institute. Founded in 1954 by the Episcopal Diocese of Texas, St. Luke's is affiliated with multiple nursing schools and three medical schools.

Volume Statistics - FY2012 (November annualized)	**Patient Payor Mix**	**Patient Demographics**
Hospital admissions - 28,856 Emergency visits (including community emergency centers) - 85,631 Outpatient visits - 108,224	Self-Pay - 4.2% Medicaid and CHIP - 4.0% Medicare - 47.6% Other Funding - 3.2% Commercial Insurance- 41.0%	Caucasian - 48.2% African American - 29.8% Hispanic - 14.4% Asian - 2.5% American Indian - .2% Other - 4.9%

Intervention(s):
The purpose of this project is to build a bridge from the acute inpatient setting to a stable primary care-based medical home for patients with congestive heart failure (CHF). The targeted population is that group of patients with CHF cared for in the SLEH acute inpatient setting for an index admission. The goal is to reduce readmissions.

Need for the project:
Approximately one forth of patients discharged from the hospital with congestive heart failure are readmitted within 30 days of discharge. A primary cause for readmission is failure to gain rapid access post discharge to primary care. Evidence suggests that access within the first seven days post discharge can reduce readmission rates by up to 30%.

Target Population:
All patients discharged from St. Luke's Episcopal Hospital with congestive heart failure.

Category 1 or 2 expected patient benefits:
Reduction in readmission rate of 30%. Improve reported health days by 25%.

Category 3 outcomes:
Outcome Measure: OD-3/IT-3.2 Potentially Preventable Re-Admissions – 30-day Readmission Rates (PPRs)/Congestive Heart Failure 30-day Readmission Rate
Outcome Measure: OD-10 Quality of Life/Functional Status

Project Option 2.12.1- Develop, implement and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions : Transitional Care for Chronic Disease

Unique RHP Project Identification Number: 127300503.2.1
Performing Provider Name/TPI : St. Luke's Episcopal Hospital/127300503

Project Description:
St Luke's Episcopal Hospital proposes to provide transitional care services to a targeted population with congestive heart failure (CHF).

The purpose of this project is to build a bridge from the acute inpatient setting to a stable primary care-based medical home for patients with congestive heart failure (CHF). The targeted population is that group of patients with CHF cared for in the SLEH acute inpatient setting for an index admission. The goal is to reduce readmissions.

Goals and Relationship to Regional Goals:

Congestive Heart Failure (CHF) is a high-cost chronic condition which affects many patients and their families in Harris County. It is a debilitating disease, though manageable in a primary care setting.

The goal of this project is to create a medical home structure for CHF patients, allowing them to maintain their health while in the community rather than a facility. For many patients, this will shift treatment from costly inpatient services, to primary care and outpatient settings, reducing costs, while enhancing each patient's quality of life.

This goal supports the region's efforts to increase reliance on primary care services, where feasible, and transform the delivery of health care services from one which emphasizes facility-based treatment, to one focused on non-acute care.

Project Goals:

The goal of the project is to reduce inpatient costs for CHF patients by providing comprehensive preventive care outside the hospital.

This project meets the following Region 3 goals:

- Transform health care delivery from a disease-focused model of episodic care to a patient-centered coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system; and
- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure.

Challenges:

The greatest challenge will be to overcome the reliance on the part of patients and providers to treat CHF primarily in an acute care setting.

5-Year Expected Outcome for Provider and Patients:

St. Luke's expects to see improvements in CHF outcomes, specifically related to hospital admissions and readmissions.

Starting Point/Baseline:

This is a new initiative. A baseline will be developed once the program is operational.

Rationale:

The rationale for the project is to build a bridge from the acute inpatient setting to a stable primary care-based medical home for patients with congestive heart failure (CHF). The targeted population is that group of patients with CHF cared for in the SLEH acute inpatient setting for an index admission.

Project Components:

St. Luke's will address each of the required core components, including the following.

Review best practices from a range of models - The keys to achieving our goal begin with the development of a Transitional Care Clinic. This approach begins the facilitated patient connection process at the time of an index admission. Transitional Care Clinic based staff will overlap with the acute inpatient staff to reduce failures to coordinate care. This ensures that effective patient education and medications management occurs and brings focus on social barriers that contribute to failure.

A number of interventions aimed at building capacity for transitional care have demonstrated effectiveness (BOOST, Project RED, etc.). Generally based on Dr. Ed Wagner's model of chronic disease (http://www.grouphealthresearch.org/research/areas/chronic.aspx), a clinic specifically designed to provide access within the first 7 days (or sooner if necessary) can reduce readmissions by up to 30%. The same clinical function can provide interim care until a transition to a stable primary care relationship can occur for patients without an established relationship. Concurrent development of robust relationships with community-based providers provides the connection to stable primary care for at-risk populations.

Conduct an analysis of the key drivers of 30-day hospital readmissions using a chart review tool - The key driver of ED visits and early readmissions following acute care hospitalization is the failure to manage the inpatient transition to a stable primary care relationship. Access represents the major barrier to receiving stable care. The reasons for poor access can be financial, social or provider availability. The most vulnerable period occurs early following discharge with probability of readmission increasing with time from discharge to initial follow-up appointment. Without ready means of access, the Emergency Room is often the portal of entry. Risk assessment for readmission will be conducted using the IHI STAAR Tool.

Integrate information systems – Data sources will be Epic EHR and claims-based administrative databases (UHC, Crimson) as well as publically reported data sets (Hospital Compare).

Develop system to identify at-risk patients - Risk assessment for readmission will be conducted using the IHI STAAR Tool on admission.

Implement discharge planning and post discharge support - The first post hospitalization visit is the bridge to the next level of care and stable primary care in a medical home. Development of partnership relationships with community-based organizations is so important for patients who have otherwise been disenfranchised.

Embedded within the clinical operation are support services to address social determinants such as transportation, in-home support, lifestyle coaching and more traditional interventions such as nutritional status. The integration of services at one site of care ensures necessary collaboration and cooperation to address short-term markers of care process failure, such as ED visits and premature readmissions.

Develop a cross-continuum team - Currently St. Luke's Episcopal admits approximately 6000 patients annually for heart failure. Each patient would undergo a risk assessment on admission (IHI STAAR Tool) and a specific plan of care unique to each patient would be developed. The focus of the assessment is a determination of transitional care needs and facilitation at time of discharge into a stable primary care relationship. If a relationship currently exists, care will be coordinated with the existing provider focused on access to the first post-discharge visit within 7 days.

If the primary care provider cannot see the patient within seven days, an appointment can be arranged in the Transitional Care Clinic with consent of the patient and in coordination with the primary provider.

If the patient does not have a primary care provider, initial follow-up will be through the Transitional Care Clinic where facilitation occurs into a stable primary care relationship, taking into account the patient's wishes, location of residence, and other social determinants. Community based organizations provide an opportunity for transition to a stable primary care relationship (includes a qualified FQHC).

Conduct quality improvement - Significant focus is on the patient's assessment of Quality of Life as measured by the CDC-HRQOL, which includes embedded scales for Healthy Days Core Module, Activities Limitations Module, and Healthy Days Symptoms Modules.

The initial phases of the project recognize that short-term measures focused on process metrics may change before major outcomes changes, like readmissions or mortality begin to move. For this reason, days between admissions serves as a directional proxy in the first year of patient enrollment.

Data sources will come from Epic EHR and claims-based administrative databases (UHC, Crimson) as well as publically reported data sets (Hospital Compare). Process improvement methodologies will be based on The Model for Improvement (IHI) and will incorporate other tools as appropriate to include LEAN, Six Sigma, and Statistical Process Control tools. The project will have access to an IHI trained Improvement Advisor as a principle consultant.

Critical success factors and key challenges include:
Coordinated information flow
Shared ownership of patient population
Centralized registry of patients
Optimization from the patient's perspective
Common shared clinical care pathway
Common formulary

Milestone & Metrics:

The following milestones and metrics have been chosen for the transitional care program for CHF patients:

- Process Milestones: P-1, P-2 (P-2.1), P-4, (P-4.1), P-7, (P-7.1), P-9, P-9.1).
- Improvement Milestones: I-11

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project is a new initiative for St. Luke's Episcopal Hospital. The costs associated with providing this transitional care plan will all be new costs to the Hospital. The costs would include labor costs for developing and running the transitional care clinic.

Unique community need identification number the project addresses:

- CN.1 Inadequate access to primary care
- CN.2 Inadequate access to specialty care
- CN.9 High rates of preventable hospital readmissions
- CN.10 High rates of preventable hospital admissions

Related Category 3 Outcomes Measures:

OD-3 Potentially Preventable Readmissions – 30 day Readmission Rates
IT-3.2 Congestive Heart Failure 30-day Readmission Rate

OD-10 Quality of Life/Functional Status
IT-10.1 Quality of Life

Reasons/rationale for selecting the outcome measures:

The impact of this initiative can be measured by tracking readmission rates for the target population and assessing improvements in the patients' quality of life through use of a validated assessment tool.

Relationship to other Projects:

Primary Care/Ambulatory Care clinics are a top priority to Region 3 due to the acuity of the regional patient mix, population concentration, and lack of primary care access points for our patient base. The regional approach of collaboration as well as existing patient referral pattern relationships allowed our team to properly identify the community needs based on the necessity of population, uninsured, and medically underserved patient bases. This program is consistent with our region and similar to numerous initiatives in our RHP plan sharing both concepts as well as outcome measures focused to percent improvement over baseline of patient satisfaction scores, reduction of inappropriate ED utilization, and third next available appointment status. The Region 3 Initiative Grid attached as a RHP Plan addendum reflects a grid of relationship for all initiatives.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative as offered by the anchor for Region 3, Harris Health System. Our participation in this collaborative with other performing providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's health care system.

Project Valuation: The project scope includes all patients with an index admission of congestive heart failure at St. Luke's Episcopal Hospital. This is anticipated to be approximately 6,000 patients. The intervention begins with education upon admission. The care team will also provide information about the services of the Transitional Care Clinic. Prior to discharge, a follow-up appointment will be scheduled within seven days for each patient. In addition, the

care team providers will identify if the patient currently has consistent primary care support. If none is identified, the team will assist the patient in finding stable primary care.

All patients identified with CHF will be supported with this intervention; however, specific-focus will be given to those most at-risk, including the underserved and uninsured.

This addresses a high-priority community need due to the incidence of heart disease. The overall community, including Medicaid and indigent patients, will benefit by savings achieved by reducing the unnecessary and costly use of acute hospital services.

St. Luke's Episcopal Hospital

Pass 2

Project Option 2.2.2: Apply evidence based care management model to patients identified as having high-risk health care needs- Identification and Treatment of Patients with Hepatitis C

RHP Project Identification Number: 127300503.2.2 / Pass 2
Performing Provider Name: St. Luke's Episcopal Hospital / 127300503

Project Summary:
Provider:
St. Luke's Episcopal Hospital (SLEH) is a 718-bed tertiary and quaternary teaching hospital located in the heart of the Texas Medical Center and is home of the Texas Heart® Institute. Founded in 1954 by the Episcopal Diocese of Texas, St. Luke's is affiliated with multiple nursing schools and three medical schools.

Volume Statistics - FY2012 (November annualized)	**Patient Payor Mix**	**Patient Demographics**
Hospital admissions- 28,856 Emergency visits (including community emergency centers)- 85,631 Outpatient visits – 108,224	Self-Pay- 4.2% Medicaid and CHIP -4.0% Medicare- 47.6% Other Funding- 3.2% Commercial Insurance- 41.0%	Caucasian – 48.2% African American – 29.8% Hispanic – 14.4% Asian- 2.5% American Indian - .2% Other 4.9%

Intervention(s):
This project will provide screening and treatment for a defined population of patients at risk for and/or diagnosed with Hepatitis C.

Need for the project:
Hepatitis C is a potentially curable disease with significant morbidity leading to cirrhosis and liver failure. A small but significant fraction of affected patients develop hepatocellular carcinoma. These complications can be markedly reduced with active screening and aggressive treatment. CDC recommended Birth Cohort Screening of individuals born between 1945 and 1965 will overwhelm capacity without the development of alternate treatment models.

Target Population:
All patients with liver dysfunction or patients falling within the CDC recommended screening group.

Category 1 or 2 expected patient benefits:
Our DY4 goal is to triple the volume of patient screened during our baseline year. In DY 5 our goal is to quadruple screening volume over baseline and to enroll at least 50% of patients identified with active disease in treatment.

Category 3 outcomes:
Outcome Measure: OD-4/IT-4.1 Improvement in risk adjusted Potentially Preventable Complication rates (development of cirrhosis, frank liver failure) by 50%.

Project Option 2.2.2: Apply evidence based care management model to patients identified as having high-risk health care needs- Identification and Treatment of Patients with Hepatitis C

RHP Project Identification Number: 127300503.2.2 / Pass 2
Performing Provider Name: St. Luke's Episcopal Hospital / 127300503

Project Description:

The purpose of this project is to screen, identify, and provide high level care to individuals identified as having Hepatitis C using a distributed care model based on Project ECHO^{TM}.

Goals and relationship to regional goals:
Hepatitis C is a curable illness when identified and correctly treated. Estimates suggest that only a small fraction of patients with this illness are identified and an even smaller fraction are treated. Since the consequences are progressive cirrhosis, liver failure, and high risk for hepatocellular carcinoma, screening and access to effective treatment can achieve cure in up to 60% of patients. The major barriers are lack of widespread screening and access to providers knowledgeable in this field. By using newer technologies this project will partner with primary care providers throughout Region 3 to support screening, enhance the knowledge base, and support treatment in the patient's community by extending tertiary specialty support using telemedicine. This project supports Region 3 objectives by improving access to high level specialty care coordinated through primary care providers, leverages technology through use of telemedicine, and supports effective treatment in a vulnerable population where the incidence of disease may be as high as 8%.

Challenges:
Effective screening and appropriate referral for care represent the primary hurdles. The CDC recently recommended Birth Cohort Screening for all individuals born between 1945 and 1965 which will significantly increase patients identified with Hepatitis C. Our current system will be unable to manage the volume of new cases in need of active treatment.

5 Year Expected Outcome for Provider and Patient:

St. Luke's expects to increase annual screening of at-risk populations by a factor of 4 by the final year of the project (1976 patients screened in 2012). Of those identified with active disease St. Luke's hopes to engage 50% of this group in active community based treatment. Of those with active disease who remain in treatment, cure rates will match recently reported outcome data (60% cure rate).

Starting Point/Baseline:

In 2012 St. Luke’s Liver Health Outreach Department screened 1976 patients through partnerships with CBO’s and identified 155 individuals with active disease (Hepatitis C).

Rationale:

Provider

St. Luke’s Episcopal Hospital (SLEH) is a 718-bed tertiary and quaternary teaching hospital located in the heart of the Texas Medical Center and is home of the Texas Heart® Institute. Founded in 1954 by the Episcopal Diocese of Texas, St. Luke’s remains the only faith-based hospital within TMC. It is affiliated with multiple nursing schools and three medical schools, University of Texas - Houston, UTMB, and the Baylor College of Medicine. SLEH is the flagship hospital for St. Luke’s Episcopal Health System (SLEHS), comprised of six hospitals, serving all communities within the metropolitan area, and St. Luke’s Episcopal Health Charities, a charity devoted to assessing and enhancing community health, especially among the underserved.

St. Luke’s Center for Liver Disease (SLCLD) is a multidisciplinary program shared between Baylor College of Medicine and St. Luke’s Episcopal Hospital providing hepatology and liver transplantation services. SLCLD includes two transplant surgeons, seven hepatologists and five midlevel providers.

SLCLD houses the St. Luke’s Liver Health Outreach Department, which focuses on identifying, screening and testing patients at high risk for Hepatitis C within the underserved community. In 2012, the department ran 1976 HCV tests resulting in 217 (11%) antibody positive tests and 155 HCV RNA (active infection) positive tests (8%). SLCLD and the department maintain community partnerships with organizations including:

- The Association for the Advancement of Mexican Americans
- Coastal Bend AIDS Foundation (CBAF)
- Legacy Community Health Services
- Planned Parenthood of the Gulf Coast’s HIV program
- Houston Area Community Services (HACS)
- Tomagwa Health Ministries
- Brazos County Health

These partnerships have built a strong foundation for outreach within the greater Houston and Harris County area. Expansion throughout Region 3 will allow SLEH and the SLCLD to reach more high-risk individuals and create a greater health impact to the underserved individual.

Interventions:

Identification and Treatment of Patients with Hepatitis C extends high level medical skills throughout the region using telemedicine to improve care for patients with Hepatitis C. Active

identification and aggressive treatment of patients in the early stages of disease result in improved outcomes and lower cost in a population of patients at high risk.

Two factors will alter the impact of HCV infection in Region 3:

1) Patient Identification: Primary care is the front line in screening patients for HCV. Primary care providers must be educated to screen patients with risk factors for HCV, including those born between 1945 and 1965. BCS alone may identify 200,000 new cases in Texas.

2) Access to Treatment**:** Treatment has traditionally been the domain of the gastroenterologist. This is no longer tenable. Gastroenterologists in large and small communities are hard-pressed to provide all necessary GI support. HCV treatment is increasingly seen as a distraction and money-loser for GI practices. Infectious disease specialists have picked up some of the slack, but the answer is to increase the number of treating practitioners. This effect has been called a "force multiplier," and is the basis of Project ECHO™, a community outreach program established at the University of New Mexico.

In order to achieve improved identification and treatment of HCV, we will have to increase awareness of HCV infection, and we will have to train a large workforce of providers. The size of Region 3 makes this difficult to do in person (e.g. with outreach clinics), but the problem could be solved with the Project ECHO model described by Arora et al. .

Remote sites need only three IT resources: a computer, a webcam and high-speed Internet. Most practices have computers, and many computers have built-in webcams. Training each site to use the webcam and communication software will be done by phone or with Identification and Treatment of Patients with Hepatitis C resources.

Each weekly HCV clinic will consist of two portions, patient presentations and a short lecture — attendees will get two CME units per clinic.

Needs Assessment:

- *Primary care physicians are the first line providers in the community, but most do not know the risk factors for hepatitis C.*
  - *Gap: Patients in the community are not being screened for hepatitis C – only 25% of the HCV infected population in America has been diagnosed. Knowledge about appropriate screening and confirmatory testing is lacking.*
  - *Desired outcome: Community physicians will screen appropriate patients for HCV infection, confirm infected patients, and recommend treatment, when appropriate.*

- *Hepatitis C treatment is difficult, inconvenient, and associated with numerous side effects*
  - *Gap: Gastroenterologists are increasingly unwilling to treat HCV infection, so fewer patients are being treated, even though the efficacy of treatment is improving.*
  - *Desired outcome: Primary care providers will learn to provide appropriate, specialized treatment in the community.*

- *Patients with advanced liver disease may require specialized care at a referral center.*

- *Gap: Many communities do not have the resources to recognize advanced liver disease and/or implement appropriate measures. In addition, they fail to refer patients to an appropriate center in a timely fashion.*
- *Desired outcome: Community physicians learn to recognize cirrhosis, implement appropriate medical measures, and refer patients with advanced liver disease to a referral center.*

Target Population:

Based upon the St. Luke's Liver Center screening experience, we believe that between 4% - 8% of at risk populations are likely infected. If the prevalence reported in a recent Veterans Administration study (4.5%) is applied to the general population of Region 3, as many as 200,000 individuals could be infected. Enormous opportunity exists to significantly alter the disease trajectory of patients with Hepatitis C. Currently available therapies have the potential to cure up to 60% of those patients treated. This project would provide targeted funding to support dramatic expansion of screening programs along with the development of treatment capacity to meet this need. The dual problems of identifying infected patients and getting them treated is the goal of this proposal.

Milestone and Metrics:

The following milestones and metrics have been chosen for this program:

Process Milestones:

P-4.1. Metric: Increase the number of multi-disciplinary teams or number of clinic sites with formalized teams

P-10.1. Metric: Increase the number of group visits and/or telephone visits and/or other interaction types

Improvement Milestones:

I-21.1. Metric: Increase percentage of target population reached.

I-21.2. Metric: Documentation of increased number of unique patients served by innovative program. Demonstrate improvement over prior reporting period.

I-11. 1 Improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transitions policies

I-21.3. Metric: Improved clinical outcomes of target population. The clinical outcomes can be either intermediate (e.g. in Diabetes: HbA1c, lipid profile, blood pressure, serum microalbumin) or end result (e.g. mortality, morbidity, functional status, health status, quality of life or patient satisfaction).

Unique Community Need identification number the project addresses:

- CN1 - Inadequate access to primary care
- CN2 - Inadequate access to specialty care
- CN10 - High rates of preventable hospitalizations
- CN11 - High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic.

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative: This project dramatically expands the capability and capacity of the St. Luke's Center for Liver Disease (SLCLD) and Advanced Liver Therapy program to extend screening and coordinated treatment to identified patients throughout Region 3. Furthermore, access to clinical trials is available for appropriate patients. The SLCLD in conjunction with the distributed primary care network builds a continuum from screening and initial diagnosis through liver transplant. By using telemedicine links patients avoid the need for travel and or finding high end specialty care. Since cure rates with appropriate therapy approach 60%, downstream complications of disease progression should be reduced.

Related category 3 Outcomes Measures:

OD-4 / IT-4.1 Improvement in risk adjusted Potentially Preventable Complication rates

Reasons/rationale for selecting the outcome measure(s):
Untreated Hepatitis C results in progressive destruction of liver cells with resulting cirrhosis and liver failure. Patients with this disease are at significantly increased risk for the development of hepatocellular carcinoma. Since identification and effective treatment can be curative, a reduction in the rate of Potentially Preventable Complications attests to the effectiveness of the interventions.

Relationship to Other Projects and Performing Providers' Projects in the RHP:
Healthcare costs are significantly increased within a patient base with such aggressive chronic conditions that have gone untreated. The initiatives focused to chronic disease management focus to conditions such as asthma, hypertension, and diabetes and are similar in the approach of managing & proactively treating chronic conditions in order to reduce 30-day readmission rates, inappropriate emergency department utilization, and healthcare costs. The Region 3 Initiative grid allows a cross reference of initiatives associated with chronic disease management. (addendum)

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

In Year 2 as partnerships are developed beyond current relationships, 2000 individuals will be screened. In Years 3(3500) and 4(5000) the volume of screening would increase incrementally with the expected volume of screening in Year 5 reaching 8000. As these individuals would be in an at-risk group, the number of individuals identified with disease in Year 2 would be 160, Year 3 - Screened 3500, 280 with disease, Year 4 - 5000 screened, 400, Year 5 - 8000 screened, 640 with disease. Total number of individuals identified with disease over project equals 1480. If approximately 50% of 1480 new patients are engaged in active community based treatment, we would expect 60% cure rate equaling 444 patients. The lifetime cost of Hepatitis C in the absence of liver transplant is $100,000, with liver transplant, the cost rises to $280,000. Within 5 years of diagnosis, 15-20% of patients with chronic Hepatitis C develop cirrhosis. Consequently, diagnosis, treatment and cure dramatically lower costs for treatment of a chronic disease.

Texana Center

Pass 1

Project Option 2.13.1 - Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population: Provide crisis stabilization intervention for the dually diagnosed population to prevent unnecessary use of services in State Supported Living Centers, emergency rooms, state mental hospitals and county jails.

Unique RHP Project Identification Number:081522701.2.1

Performing Provider Name/TPI: Texana Center / 081522701

Project Summary:

This project will create a crisis behavioral health care team to intervene to keep individuals in crisis out of the State Supported Living Centers, emergency rooms, state mental hospitals or jail.

Provider Description:

Texana Center is the Local Authority for Behavioral Healthcare and Intellectual Developmental Disabilities Services for 6 counties within the RHP 3 area: Austin, Colorado, Fort Bend, Matagorda, Waller and Wharton. Texana Center serves approximately 9,800 people annually (an estimated 7,000 in BH services and 3,000 in IDD services), employs 742, and has an annual operating budget of $39,211,988.

Intervention(s):

Design, implement and a research-supported and evidence-based crisis behavioral health care team. Interventions include assessment during acute crisis, treatment plan development by Board Certified Behavior Analyst, monitoring by psychiatrist and nurse, training individuals and care givers in Applied Behavior Analysis, and therapeutic respite. Interventions are to be provided by a clinical team with the purpose to avert institutional care and preserve community living through an innovative crisis behavioral health care team model.

Need for the Project:

As the Local Authority, we receive requests to assist families, and providers, dealing with acute crisis for individuals at risk for placement outside of their home. There is no therapeutic respite facility open to all providers in our area, and there is no crisis response team trained in the therapeutic assessment and treatment of the targeted population. There are over 200 active Medicaid providers of long term services and supports for the targeted population in our area. Most are small business operations, and many are new providers with limited resources and experience in the provision of crisis prevention services.

Target population:

Individuals dually diagnosed (intellectual and developmental disability (IDD: i.e., autism, pervasive developmental disorder (PDD) or mental retardation (MR)) who have a co-occurring serious and persistent mental illness and/or a history of challenging and harmful behaviors. The estimated baseline is 1,100 – 1,300 people with a dual diagnosis, with 600 of these people potentially experiencing an acute crisis during the project's 5 year period. Approximately 90% of persons served are currently Medicaid eligible and/or indigent. Based on these estimates, we expect that potentially 540 Medicaid eligible and/or indigent people would benefit from the project.

Category 2 expected patient benefits: The project seeks to provide acute crisis behavioral health care services through an innovative crisis team model in years three, four and five with an increase in the number of individuals served by the team and in therapeutic respite each year. The project seeks to promote the evidenced-based model through collaborative learning with other Local Authorities in the RHP area and in the state.

Category 3 Outcomes: The project seeks to reduce the number of potential admissions by the targeted population to state institutions (state mental hospitals and State Supported Living Centers) by 10% in Year 3 and 20% in Year 4.

Project Option 2.13.1 - Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population: Provide crisis stabilization intervention for the dually diagnosed population to prevent unnecessary use of services in State Supported Living Centers, emergency rooms, state mental hospitals and county jails.

Unique RHP Project Identification Number:081522701.2.1
Performing Provider Name/TPI: Texana Center / 081522701

Project Description:
Texana Center, the local authority for Behavioral Healthcare and Intellectual Developmental Disabilities services, proposes to create a crisis behavioral health care team to intervene to keep individuals in crisis out of the state supported living center, emergency room, state mental hospital or county jail.

The project will also expand respite care to respond to acute behavior events. It will also provide on-going supports to caregivers to avert crisis and establish stable living environments. The project will require the hiring of 15 staff members (7 professional/clinical and 8 behavioral certified direct care) and the addition of a 4 bed respite facility equipped with 2 clinical treatment rooms.

The project targets individuals with a diagnosis of intellectual and developmental disability (IDD: i.e., autism, pervasive developmental disorder (PDD) or mental retardation (MR)) who have a co-occurring serious and persistent mental illness and/or a history of challenging and harmful behaviors. In collaboration with MHMRA of Harris County, the project is intended to provide crisis stabilization services to the targeted population in all counties of the RHP 3 area. This project serves individuals who reside in one of the following seven counties: Austin, Calhoun, Colorado, Fort Bend, Matagorda, Waller and Wharton. The caregivers for this population are eligible recipients for training and education.

When a behavioral crisis occurs, this complex behavioral health population typically seeks crisis intervention services through the emergency room, psychiatric in-patient system or law enforcement. In these cases, a frequent long term solution is admission to a State Supported Living Center. Individuals with IDD who have a co-occurring SPMI/challenging behavior enter into a cycle of crisis driven care: the individual receives long term supports from a designated in-home caregiver who is unable to manage challenging behaviors; the behaviors result in an acute crisis; the treatment for the crisis is hospitalization or out of home institutional care, which does not involve the caregiver in the treatment plan; the crisis resolves and the individual returns home to the caregiver who still lacks competencies for managing the behaviors; the challenging behaviors reoccur and result in an acute crisis; the cycle repeats, and this complex population becomes a frequent user of local public health systems.

As a solution to the cyclic pattern of long term support and acute crisis intervention for the dually diagnosed IDD/SPMI population, this project proposes the development of a crisis behavioral healthcare team, expanded out-of-home respite care to respond to acute behavior crisis events, and on-going supports to avert crisis and establish stable living environments. The crisis behavioral health care team will respond to acute crisis and will design, implement, and monitor individualized treatment plans for individuals admitted to the project.

Deleted paragraph

Goals and Relationship to Regional Goals:

The project supports the RHP 3 regional goal for developing a culture of ongoing transformation and innovation that maximized the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes. This project also supports regional goals to address the gaps in the service delivery system for individuals with complex mental health conditions. These individual require stable living environment integrated with community-based clinical psychosocial services to prevent continual cycling through less appropriate, more costly settings.

5-Year Expected Outcomes for Provider and Patients:

- A significant decrease in the number of behavioral health events resulting in hospitalization, incarceration or institutional care for individuals with IDD
- A significant increase in the number of individuals with IDD who have access to behavior supports provided by Board Certified Behavior Analyst and who have access to emergency respite

Starting Point/Baseline:

The NADD, an association for persons with developmental disabilities and mental health needs, reports that many professionals have adopted the estimate that 30-35% of all persons with an intellectual developmental disability have a psychiatric disorder.[241] By applying the NADD estimated percentage (30-35%) to the intellectual and developmental disabilities population in our area (3,650: 1,250 served; 2,400 not served), it is estimated that the baseline population is 1,100-1,300 people with potential needs for the crisis stabilization services proposed in this project. This number is consistent with state data source (CARE), which reported 1,427 individuals with IDD and a co-occurring SPMI or diagnosis of autism or PDD being screened, assessed or served through Texana Center in 2011. Based on provider service data for 2011, it is estimated that about 50% of the baseline population received some type of crisis stabilization encounter (i.e., intensive behavior supports and/or emergency respite), meaning that there were approximately 600 under-served individuals. Approximately 90% of the persons served are currently Medicaid eligible and/or indigent. Based on these estimates, we expect that potentially 540 Medicaid eligible and/or indigent people would benefit from the project.

There are over 200 active Medicaid providers of long term services and supports for the targeted population in our area, but there is no crisis response team and no therapeutic crisis respite facility. Most providers are small business operations, and many are new providers with limited resources and experience in the provision of crisis prevention and services.

Rationale:

The implementation of a long-term crisis intervention and stabilization services model is intended to promote health and safety, to promote self-management of challenging behaviors, and to avoid risks requiring hospitalization, incarceration or institutionalization. Texana Center selected this project for the following reasons:

- Data driven: As noted in the baseline above, local data demonstrates that there is a growing number of individuals with IDD with challenging behaviors and/or SPMI, who are seeking respite and behavioral supports in the community
- Community Need: This project addresses the community need for expanded behavioral healthcare: RHP CN 2 - Insufficient access to behavioral health care services, resulting in

[241] Source: NADD website: http://thenadd.org/resources/information-on-dual-diagnosis/

lack of care or delay of care, delivery of inappropriate and insufficient care, unnecessary and preventable complications, and increased demand on criminal justice system.

- Cost effective: This project's goal is to avert the cost of long term crisis intervention through provision of in-home and community setting care. The following cost savings were considered in the selection of this project: average annual cost for State Supported Living Center of $177,624 compared to average annual cost rate the Home and Community Based Care (HCS) Waiver of $39,588 [242]; the average stay cost for psychiatric in-patient care at a State Mental Hospital of $15,325 compared to the annual per person Behavioral health community center cost of $1,181[243] ; the average cost of an emergency room visit of $383 compared to primary care visit cost of $60[244]; and the annual cost for incarceration rate at State prison of $18,582[245] compared to the non incarceration cost of zero. The intent of this project is to ensure that patients utilize the most cost efficient service identified by these comparisons.
- State and Federal Initiatives: This project, through the implementation of behavioral support teams and access to respite for individuals in crisis, represents a significant enhancement to the long-term care IDD services and supports system and is consistent with current State and Federal initiatives.
    - In 2009, the Community Living Initiative was implemented by the U.S. Department of Health and Human Services (HHS).[246] Through this initiative, HHS partnered with State and Local authorities to develop strategies to create infrastructure to effectively serve individuals with IDD. This work helped advance systems of care to meet the directive of the 1999 *Olmstead* decision.
    - North Carolina implemented the NC START (North Carolina Systemic, Therapeutic Assessment, Respite and Treatment) Program as a partner in the Community Living Initiative, which, like this project, provided clinical behavior support teams and out of home respite to the IDD with SPMI/challenging behavior population.[247]
    - In 2011, the Texas Legislature directed the Texas Health and Human Services Commission to seek a Medicaid waiver that "allow[s] for the redesign of [IDD] long-term care services and supports to increase access to patient-centered care in the most cost –effective manner" (SB7, 82nd Texas Legislature, 1st Called Session). A key feature for the redesigned system for individuals with IDD is behavioral supports for individuals at risk of institutionalization.
    - There is an on-going agreement settlement between the Texas and the Department of Justice for ensuring access to community services for persons served in institutions.

Access to crisis intervention and stabilization services in the community is an expectation of the Department of Justice through this agreement.[248] This project, through the implementation of behavioral support teams and access to respite for individuals in crisis, represents a significant enhancement to the long-term care IDD services and supports system to provide the right service at the right time in a most cost-effective manner.

- Regional Pilot: MHMRA of Harris County implemented a behavioral healthcare crisis intervention team for this targeted IDD population in 2011. The model has been well received at the local and state level.
- Experience: As a starting point, Texana Center has the administrative support and clinical expertise to assess and develop a plan for a long term crisis intervention and stabilization model for this targeted population:
  - Out of home emergency respite: Texana Center has operated an out of home respite facility for over 20 years.
  - Applied Behavior Analysis: Texana Center employs Board Certified Behavior Analyst to assess, treat and monitor challenging programs in four program areas: day program, residential, site-based and outreach. These programs have an excellent reputation for successful treatment of challenging behaviors.

Consistent with the DSRIP Category 2 Behavioral Health Infrastructure menu, this project incorporates the required core components for Project Option 2.13.1: *Design, implement and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population (IDD with SPMI/Challenging behaviors).*

- An assessment of size, characteristics and needs of the IDD with SPMI/Challenging behavior population.
- A review literature /experience with populations similar to the IDD with SPMI/Challenging behavior population.
- A project evaluation plan using qualitative and quantitative metrics to determine outcomes.
- A service delivery model to include the following community based interventions:
  - Referral paths for IDD Crisis Stabilization team through outreach and education with law enforcement, emergency rooms, and agencies providing residential supports to persons with IDD.
  - Behavioral healthcare intervention team consisting of project director, Board Certified Behavior Analysts, case coordinators and registered nurse to assess individuals in crisis, develop treatment plans and monitor care.
  - Visiting nursing and community health workers with crisis intervention expertise
  - Specialized behavioral therapies:
    - On-site assessments and interventions to stabilize acute crisis situations
    - Individualized treatment plans to help the individual return to his/her current living situation, and to successfully maintain that setting
    - Intensive training in Applied Behavior Analysis (ABA) techniques to individuals, family members and caregivers
  - Medication assessment with weekly psychiatric consultation.

[248] Source: Texas Department of Aging and Disability Services website: http://www.justice.gov/crt/about/spl/documents/TexasStateSchools_settle_06-26-09.pdf

- Out of home respite for crisis stabilization and based on population needs.
- Other community based interventions as determined by the project assessment.

- An assessment of the impact of the interventions based on standardized quantitative measures and qualitative analysis.
- A continuous quality improvement framework to include collaborative learning with other providers for the IDD with SPMI/Challenging behavior population.

Milestones & Metrics:
Milestones 2.13.1 (Assessment), 2.13.2 (Designing/Planning), 2.13.3 (Enrolling/Serving), 2.13.5 (Collaborative Learning) were selected to support the above listed required components. As an improvement measure, assessment of improvement in functional status was selected for Category 2. See section to follow regarding related Category 3 Outcome Measures.
Deleted Paragraph
Related Category 3 Outcome Measures:
IT-9.4 Other Outcome Improvement Target- Mental health (IDD/SPMI or Challenging Behaviors) admissions and readmissions to state institutions (state mental hospitals and State Supported Living Centers)

This project supports and reinforces Quality Improvement projects in Category III related to potentially preventable admissions and readmissions for behavioral health populations. Contingent upon the baseline assessment completed in DSRIP Year 2, the following related Category 3 Outcome Measures, Outcome Domain 9 – Right Care, Right Setting, may apply:

- Decrease in mental health (by targeted population -IDD with co-occurring SPMI or Challenging Behaviors) admissions and readmissions to criminal justice settings such as jails or prisons
- Decrease in Emergency Department visits for target population (IDD with co-occurring SPMI or Challenging Behaviors)
- Decrease in admissions and readmissions to skilled Intermediate Care Facilities (ICF/ID)- State Supported Living Centers

This project's goal is to avert the cost of long term crisis intervention through provision of in-home and community setting care. Consistent with the project's goal for continuous quality improvement, Category 3 includes a Process for Plan, Do, Study, Act (PDSA). Admissions and readmissions to criminal justice settings and to long term care settings can help avert poor health and mental health outcomes, reduce long term medical costs and improve functioning. See Rationale section above for supporting data.
Relationship to other Projects: The development and improvement of services for patients with behavioral health disorders is a focus of multiple projects throughout the RHP, including those in Category I for expanding access and Category II for developing innovative solutions to priority issues. This project supports areas focusing on the expansion and development of medical home models, expansion and development of preventive and urgent care, and improvement in the quality of life for patients.

Relationship to Other Performing Providers Projects in the RHP:
Numerous community needs assessments reflect an extreme need for behavioral health services to include outpatient treatment centers, crisis stabilization units, inpatient beds, and much more. The lack of funding as well as complexity of the region's patient base has limited the amount of behavioral health treatments available to our region and continues to drive cost in emergent and inpatient situations. The Crisis Stabilization Unit has a direct correlation to all behavioral health

programs recommended in the RHP plan and will be a focus of two of the largest Local Mental Health Authorities of our region. Both CSU's share the outcome measures of mental health admissions & readmissions, and improvement of patient satisfaction scores. The Region 3 Initiative Grid attached in the addendum reflects the direct relationships of this initiative.

Local Authorities for IDD (Intellectual Developmental Disabilities) are a large focus of our community including our local mental health authorities in the region. The IDD concepts focus to outcome measures of patient satisfaction scores, and admission/re-admission rates. There are two initiatives in the RHP plan with a focus to IDD and are represented in the addendum (Region 3 Initiative Grid).

Deleted paragraph

Plan for Learning Collaborative:

Texana Center and MHMRA of Harris County share a network of providers for Medicaid services (Home and Community Based Services Waiver, Texas Home Living Program, and ICF/ID programs), and collaborate to meet monthly with the providers for an exchange of information. Through this project, Texana Center and MHMRA of Harris County will expand this collaboration to include monthly telephone conferences to share best practices, new ideas and solutions for the crisis stabilization projects. The established provider meetings will provide an effective forum for gathering input of stakeholders in the projects processes. Additionally, both Texana Center and MHMRA of Harris County meet with representatives of Local Authorities statewide on a quarterly basis, and will request that these meetings include information sharing about similar projects in other areas of the state.

Through this expanded learning collaborative, Texana Center and participating Local Authorities will share challenges, testing of new ideas and solutions. Additionally, Texana Center plans to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system. This exchange will facilitate effective processes, efficient use of resources, and consistent data benchmarking across similar projects statewide.

Project Valuation: This project addresses a priority need for the IDD/SPMI population to receive intensive crisis stabilization services in the community. By doing so, it also allows for cost avoidance, supporting individuals in the community at a lesser cost than institutional care in state hospitals and State Supported Living Centers, and avoiding costs in the criminal justice system and emergency rooms. This project was valued based on two studies completed by the UT Houston School of Public Health and the UT Austin Center for Social Work Research: "Valuing the Program to Create an Assertive Community Treatment (ACT) Team for People with Intellectual and Developmental Disabilities (IDD)" and "Valuing the Crisis Respite for Children Program". These studies were completed through a contract with Center for Health Care Services, and were based on cost-utility analysis measures and quality-adjusted life-years analysis.

Texas Children's Hospital

Pass 1

Project Option-2.1.4 "Other" project option: Expand Medical Homes for Transition Population

Unique Project ID: 139135109.2.1

Performing Provider and TPI: Texas Children's Hospital/139135109

Project Summary:
Expand a medical home to serve additional adolescent/ young adults with significant chronic childhood conditions.
Provider:
Texas Children's Hospital, located in Houston, is the largest free standing children's hospital in the county specializing in the care of medically fragile children in Houston and across the country as a regional safety net provider. We currently are licensed for 564 beds and in 2011 we had over 2.7 million patient encounters. Our mission is to provide the finest possible pediatric and women's patient care, education, and research. Texas Children's is an integrated delivery system comprising of a health plan for Medicaid and CHIP pregnant women and children, the nation's largest general pediatrician group and two world class hospitals.

Volume Statistics - FY2012	Patient Payor Mix	Patient Demographics
Hospital Admissions- 25,966 Births (babies delivered)- 2,181 Emergency visits-113,586 Outpatient visits- 3,066,765	Medicaid and CHIP- 53.6% Commercial Insurance- 40.6% Self-Pay- 1.8% Medicare- 1.2%	Hispanic- 35.9% African American- 16.6% Caucasian- 31.0% Asian- 3.8% Other- 12.4% American Indian- 0.3%

Intervention(s):
The project will offer a medical home to adolescent/young adults with significant chronic childhood conditions. The clinic will not only offer health care and prevention services but also proactive care coordination and case management to a very vulnerable population of patients. The clinic will emphasis quality of care, increase patient satisfaction and address patient safety by preventing emergency room visits and acute hospital stays.
Need for the project:
The majority of adolescent/young adults with chronic childhood conditions have difficulty engaging in adult health care services as they age out of the pediatric health care system because of numerous barriers they face such as adult health care providers who haven't been trained to care for pediatric conditions, unfunded or poorly funded insurance and time consuming care. Many of these patients end of using the emergency room for episodic care.
Target Population:
All adolescent/young adults, age 17 and up who have a life threatening chronic childhood condition in Harris County could benefit from having a medical home with adult health care providers who are dedicated to caring for this vulnerable population of patients.
Category 1 or 2 expected patient benefits:
Our DY 3 goal is to increase patient visits by 20% from the baseline in fiscal year 2012. DY4 goal is to increase patient visits by 30% from the baseline in fiscal year 2012. DY 5 goal is to increase patient visits by 40% from the baseline in fiscal year 2012.
Category 3 outcomes:
IT-6.1 Our goal is improve patient satisfaction

Project Option-2.1.4 "Other" project option: Expand Medical Homes for Transition Population

Unique Project ID: 139135109.2.1
Performing Provider and TPI: Texas Children's Hospital/139135109

Project Description:
Texas Children's Health will establish a patient centered medical home for medically fragile children in order to provide proactive care coordination, chronic disease management, and a multi-disciplinary approach that educates patients and providers on appropriate transition processes.

Texas Children's Hospital, located in Houston, is the largest free standing children's hospital in the county specializing in the care of medically fragile children in Houston and across the country as a regional safety net provider. We currently are licensed for 564 beds at our main campus and West Houston facilities. In 2011 we had over 2.7 million patient encounters. Our mission is to provide the finest possible pediatric patient care, education, and research. Texas Children's is an integrated delivery system comprising of a health plan for Medicaid and CHIP pregnant women and children, the nation's largest general pediatrician group and two world class hospitals. Texas Children's supports a commitment to quality service and cost-effective care to enhance the health and well-being of children locally, nationally and internationally.

Due to recent advancements in health care, over 90% of children with special health care needs now live into adulthood.[249] Over 11.2 million children with special health care needs, including those with chronic illnesses and disabilities, live in the United States, and, nationally, only 40% successfully transition from the pediatric to the adult health care setting. [250] Texas accounts for 9% of this total with over 1 million children with special health care needs, and, of this population, only 35% successfully transition into the adult health care environment. Across the country, approximately 500,000 adolescents and young adults with chronic, pediatric-onset diseases such as spina bifida, Down syndrome, cerebral palsy, congenital heart disease, autism, and numerous genetic disorders will reach the age of necessary transition this year (18-21 years of age).[251] Patients who do not transition to appropriate adult providers end up seeking care at Texas Children's emergency room. For children and adults, especially those with health care needs that exceed the abilities of the primary care provider, access to and coordination with subspecialty care is critical to ensuring the provision of efficient and effective health care and in securing a comprehensive medical home. This project will expand a Meds/Peds primary care approach for this patient population and establish a patient centered medical home for the

[250] Pollack, Lauren and Peggy McManus. "Health Care Transition from Pediatric to Adult Health Care: National and State Tables from the 2009/2010 National Survey of Children with Special Health Care Needs." *The National Alliance to Advance Adolescent Health*. February 2012.

[251] Newachek P, Taylor W. Childhood chronic illness: Prevalence, severity, and impact. *Am J Public Health*. 1992; 82 (3): 364-371.

population in order to provide proactive care coordination, chronic disease management, and a multi-disciplinary approach that educates patients and providers on appropriate transition processes.

Goals and Relationship to Regional Goals:

Project Goals: To meet the growing demand for medical home services TCH will:

1. Improve data exchange between hospitals and affiliated medical home sites
2. Develop best practices plan to eliminate gaps in the readiness assessment
3. Hire and train team members to create multidisciplinary teams including social workers, patient navigators, care managers, and nurses with a diverse skill set that can meet the needs of the shared, high-risk patients
4. Implement a comprehensive, multidisciplinary intervention to address the needs of the shared, high-risk patients
5. Evaluate the success of the intervention at decreasing ED and inpatient hospitalization by shared, high-risk patients and use this data in rapid-cycle improvement to improve the intervention.

This project meets the following Region 3 Goals:

- Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly
- Insufficient access to care coordination practice management and integrated care treatment programs

Increased access to appropriate care leads to better long term outcomes in children and reduction in unnecessary health care costs.[252]

Challenges:

In Texas, limited Medicaid reimbursement is an ongoing challenge for children's hospitals and the workforce that provides health care services for the pediatric population enrolled in this program and even more so for this patient population as they are moved over into the adult Medicaid system of care. As advocates for improving and sustaining quality children's health care, our organization informs and educates elected officials and community leaders about the importance of Medicaid and the need to adequately fund the program. We will continue these efforts throughout the duration of waiver to ensure existing programs and services will be maintained and expanded. In addition to the inadequate reimbursement model for Medicaid, another challenge with this population of patients is adult health care providers are not familiar with chronic childhood conditions such as Down syndrome and spina bifida as they are not adequately trained as medical students and residents on how to provide care for them. A large percentage of these patients are underinsured (Medicaid) and require labor intensive and time consuming care.

[252] *Reducing Costs Through the Appropriate Use of Specialty Services*. Cambridge: Institute for Healthcare Improvement, 2007.

By having this clinic in an academic setting we are addressing provider readiness by training adult health care providers such as internal medicine residents and family residents and in addition exposing medical students and other allied health care providers to this patient population. Efforts to add transition healthcare to medical student and resident curriculum are ongoing and in the future, CME (continuing medical education) opportunities for practicing physicians are being planned. We are also recruiting Med-Peds residents into the practice of transition medicine as they are uniquely qualified to care for this population of patients. Because of the possible opportunity to care for this population of patients, interest from Med-Peds physicians is growing to championing this effort. Another barrier is family readiness. Many of patients and their families will have significant health care issues superimposed on a developing child resulting in health care needs that are constantly changing in the pediatric health care system. This leaves no time for health care providers and their patients to start the transition process as they age out of the pediatric health care system.

Five year expected outcome for provider and patients:
Texas Children's Hospital expects to see improvements in coordination of care provided to the individuals enrolled in the patient centered medical home. We expect this in turn will improve patient satisfaction due to the delivery of the right care at the right place at the right time.

Starting Point/Baseline: The transition clinic will increase the number of patients seen from 400.

Rationale:
Inadequate access to primary and specialty care has contributed to the limited scope and size of safety net health systems. This project will establish a "home base" for patients, where patients have a health care team that is tailored to the patient's health care needs, coordinates the patient's care, and proactively provides preventive, primary, routine and chronic care, so that patients may see their health improve, rely less on costly emergency department (ED) visits, incur fewer avoidable hospital stays, and report a greater patient experience of care. Since the targeted population includes adolescents and young adults with chronic and/or special health care needs, staff will focus great energy in appropriate care coordination and disease management in order to eliminate the historical drop of care for this patient group.

Furthermore, proactive care coordination across multiple sub-specialties, along with access to medical home physicians and staff, will reduce the number of unnecessary EC visits and hospital admissions while simultaneously reducing the associated costs. Additionally, this project will enhance the patient experience by providing care in an appropriate setting for the patient's age and educating the patient and/or family as they transition into the role of primary health care decision maker. For adolescents with health care needs that exceed the abilities of the primary care provider, access to and coordination of specialty care is critical to ensuring the provision of efficient and effective health care and in securing a comprehensive medical home. Increasing pediatric population living into adulthood with chronic pediatric diseases is driving the need for increased access. Our project significantly enhances the existing transition services available to this growing population.

Project Components: Through the expanded access to the transition medicine medical home, we propose to meet all required project components listed. These selected milestones and metrics do relate to project components.

www. Expand Transition Medicine Medical Home Services
xxx. Implement transparent standardized referrals across the system
yyy. Increase service availability hours

Milestones and Metrics
The following milestones and metrics have been chosen for the project based on the core components and the needs of the targeted pediatric population.

- Process milestone and metrics: P-X, P-8 (P-8.1)
- Improvement milestones and metrics: I-15 (1-15.1)

Unique community need identification numbers the project addresses:

- CN. 2 Inadequate access to specialty care
- CN. 6 Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Currently the Baylor Transition Medicine Clinic is only one of a hand full of clinics in the United States that is specifically serving adolescent/young adults with significant childhood conditions as they move out of the pediatric into the adult healthcare system. This project will allow the clinic to significantly expand the scope of services across the city of Houston and Harris County so that this patient population will have a seamless transition into accessible healthcare that is coordinated, comprehensive and compassionate.

Related Category 3 Outcome Measure(s):
OD-6 Patient Satisfaction
IT-6.1 Percent improvement over baseline of patient satisfaction scores
Reasons/rationale for selecting the outcome measures:
Our project will increase appropriate access to patient centered coordinated care. Increased access to appropriate care leads to better long term outcomes in children and reduction in unnecessary health care costs.[253] This population will still need to be hospitalized but we believe that through appropriate access and care coordination we will be able to reduce the cost of care.

Relationship to other Projects: All of Texas Children's projects are working to expand appropriate access to subspecialty care for the pediatric population. Texas continues to have a growing pediatric population and a shortage of specialized pediatric providers. This project will help those patients who grow up at Texas Children's to transition to appropriate adult providers.

Primary Care/Ambulatory Care clinics are a top priority to Region 3 due to the acuity of the regional patient mix, population concentration, and lack of primary care access points for our patient base. The regional approach of collaboration as well as existing patient referral pattern

[253] *Reducing Costs Through the Appropriate Use of Specialty Services*. Cambridge: Institute for Healthcare Improvement, 2007.

relationships allowed our team to properly identify the community needs based on the necessity of population, uninsured, and medically underserved patient bases. This program is consistent with our region and similar to numerous initiatives in our RHP plan sharing both concepts as well as outcome measures focused to percent improvement over baseline of patient satisfaction scores, reduction of inappropriate ED utilization, and third next available appointment status. The Region 3 Initiative Grid attached as a RHP Plan addendum reflects a grid of relationship for all initiatives.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative as offered by the anchor for Region 3, Harris Health System. Our participation in this collaborative with other performing providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's health care system.

Project Valuation: This project's value is based on the benefits related to cost avoidance of medical expenses and improved quality of life. For example, increased provider capacity leads to reduction in emergency room visits and reduction in inpatient hospital visits.[254] Our valuation also includes an increase in the patient's quality of life. We are using a conservative Quality Adjusted Life Year ("QALY") per year and a percentage of that QALY for the pediatric population.[255] The QALY is used as a one-time improvement in the quality of life, even though we know the patient's quality of life will be improved for many years. We recognize that this is a government funded waiver and thus we chose to have conservative valuations out of respect for the taxpayer funded program. We have academic literature citing the link between access to appropriate pediatric subspecialty care and decrease in hospital visits, both inpatient and emergency room.[3]

The Methodist Hospital

Pass 1

Project Option 2.17.1 - Design, implement, and evaluate interventions to improve care transitions from the inpatient setting for individuals with mental health and/or substance abuse disorders: Implement Care Transition Coordination

Unique Project ID#: 137949705.2.1

Performing Provider Name / TPI: *The Methodist Hospital / 137949705*

Project Summary:

Provider: Methodist is a delivery system comprised of 4 community hospitals, 1 academic medical center in the Texas Medical Center, research institute, physician organization which employs 350 physicians and operates multiple ancillary care sites throughout the Houston metropolitan area. Methodist has 13,867 employees and has 4,185 associated physicians. Methodist has been recognized as the top hospital system in Houston & Texas by US News & World Report and honored as the top ranked healthcare provider to work for by Fortune Magazine. The Methodist Hospital's payor mix for Medicaid is 4.94% and 2.87% self-pay and San Jacinto's payor mix for Medicaid is 12.87% and 11.31% for self-pay. The Methodist Hosptial is the only private hospital that provides acute psychiatric services in the Texas Medical Center as is San Jacinto in its community.

Intervention(s): By facilitating effective transitions of care to behavioral health and primary care through locations within Harris County including HARRIS HEALTH SYSTEM, MHMRA, private physicians, and SJMH Family Medicine Residency physicians we seek to help patients navigate a complicated health-care landscape, participate in mental health choices, increase their self-efficacy, provide better quality of life and prevent readmissions and prevent adverse outcomes of incarceration, chemical dependency or suicide. Outpatient Service Availability is limited, and so we hope to leverage the community mental health workers to connect and encourage care within existing primary care and mental health resources. The program will advocate primary care expansion for mental health, through the use of treatment algorithms and perhaps by embedding counselors within a primary practice who could bill "incident to" for supervised service.

Target Population: About 140,000 adults in Harris County suffer from severe mental illness, while almost half of these adults had no access to treatment from the public or private health system. Our target population is defined as those individuals who suffer from any behavioral health related condition and who are seeking care in our facilities, more specifically those who are covered by Medicaid or without insurance coverage. At The Methodist Hospital & San Jacinto Methodist Hospital we serve those with behavioral health as detailed below:

ED Visits - Self Pay & Medicaid	32,319
ED Visits - Behavioral Health - Self Pay & Medicaid	879
ED Admissions - Self Pay & Medicaid	3,596
ED Admissions - Behavioral Health - Self Pay & Medicaid	278
P Admissions - Self Pay & Medicaid	8,024
P Admissions - Behavioral Health - Self Pay & Medicaid	540

Category 1 or 2 expected patient benefits: Our project will include a number program innovation and redesign efforts. These include ensuring we have recruiting qualified people to intervene and guide care, educate staff, identify community partners, re-engineering our discharge planning process to ensure patients transition into the ambulatory care setting successfully, setting up care coordination protocols to make sure we identify patient accurately who need our assistance and following our system's CQI efforts of plan, do, check and act to ensure we're achieving our expected outcomes for this target population.

Category 3 outcomes: Our goal is that in the first year we will coordinate care follow-up post discharge to 20% and increase this to 80% by year 5.

Project Option 2.17.1 - Design, implement, and evaluate interventions to improve care transitions from the inpatient setting for individuals with mental health and/or substance abuse disorders: Implement Care Transition Coordination

Unique Project ID#: 137949705.2.1
Performing Provider Name / TPI: *The Methodist Hospital / 137949705*
Project Description:
Preventing Behavioral Health Readmissions by Implementing Care Transition Coordination
According to Healthy Peoples 2010 Mental Illness is on par with heart disease and cancer as a cause for disability. 140,000 residents of Harris County suffer from Mental Illness.[xii] Many have no access to treatment from the public or private health system. Almost 20,000 youths in Harris County are in need of treatment while only 24% of cases were addressed.[xiii]

Currently in Harris County there are limited locations for follow-up mental health care services. The MHMRA services are provided through an office in Pasadena or League City, which is more than 30-45 minutes away and many patients have limited transportation and other barriers to follow up mental health care. Care can be received at the Harris Health System clinic in Baytown where existing patients have access to a visiting Psychiatrist on site 1 half-day per week. This same scenario of limited facilities and physicians to provide ongoing chronic behavioral health care services plays itself out in Central and Northwest Harris County.

There are many barriers to effective mental health care provision. These can be grouped as patient factors, physician factors and system factors. Primary care and primary care psychiatry working together are necessary to address the care of affective and other mental illnesses.[xiv]
The intervention proposed will involve the use of community mental health workers with Behavioral Health Education who can coordinate the care of adult patients through the transition from inpatient care to outpatient levels of care including both mental health and primary care follow up. It will also include promoting and monitoring attendance at community settings such as chemical dependency programs. The community mental health workers will be located at The Methodist Hospital, San Jacinto Methodist Hospital and Methodist Willowbrook Hospital and will receive their case load from hospital discharges, referred discharges from HARRIS Harris Health Systemwho reside in these communities, and referrals from the Emergency Department. The community mental health workers will have access to hospital medical records including discharge planning. Ideally the information from SJMH and Harris Health System may be available through shared information systems between EPIC software and Methodist IT platforms. This will involve a software program called Medicity, which is contained in Methodist Connect and Harris County Health Connect. It will also involve securing patient consent for this level of information exchange.
The community mental health worker will then follow recognized treatment protocols to query patient compliance with treatment and contact the primary care physician or mental health specialist. The care transition manager may refer to specialized disease management programs, such as those for alcohol or chemical dependency. To assist primary care physicians providing mental health follow up, treatment algorithms can guide treatment selection and increased quality and consistency of treatment, provide better clinical outcomes, and more efficient use of health care resources. The care will be directed toward the use guidelines including the Texas Medication Algorithm Project, (TMAP).[xv] It will also include recommending sequenced care

such as the Sequenced Treatment Alternatives to Relieve Depression, (STAR-D), which assist patients and clinicians implementing "next step" treatment options.[xvi] It involves patient-choice and buy-in as well as use of patient-completed rating scales such as the "Quick Inventory for Depressive Symptoms" to monitor response to treatment and alert when urgent outpatient mental health care or crisis intervention is necessary.[xvii] Objective measurements such as this can assist the transitions nurse in evaluating severity or priority.

By facilitating effective transitions of care to behavioral health and primary care through locations within Harris County including Harris Health System, MHMRA, private physicians, and SJMH Family Medicine Residency physicians we seek to help patient navigate a complicated health-care landscape, participate in mental health choices, increase their self-efficacy, provide better quality of life and prevent readmissions and prevent adverse outcomes of incarceration, chemical dependency or suicide.

The costs associated with this program will include IT costs, Space Costs and Salary Costs.

Goals and Relationship to Regional Goals:

This project meets the following regional goals:

This program would meet the following three regional health goals #1 by leveraging and improving on existing programs and infrastructure. #2 by increasing access to primary and specialty care services, with a focus on underserved and the Medicaid populations. It will ensure patients receive the most appropriate and accessible care for their condition, regardless of where they live or their ability to pay. #3 It will transform from disease-centered emergency room care to patient-centered preventive approach to behavioral health care. It also reduced duplication of uncoordinated services currently received from county and private health care.

Challenges:

- Recruitment of qualified community mental health workers
- Recruitment of psychiatrists & acute care nurse practitioners
- Patient compliance

5-Year expected outcome for Performing Provider and Patient:

Focused effort to transition patients from the acute and ED setting with behavioral health conditions will improve outcomes and reduce costs. We aim to reduce repeated admission to our inpatient psychiatric units and reduce repeat emergency room visits from our targeted population. Patients will benefit from a more hands-on, compassionate and integrated care coordination system for behavioral healthcare. This should translate to a reduction of demand for incarcerated patients with mental illness and an improvement in the daily productivity from those who benefit from our program.

Starting Point/ Baseline:

We can get a partial measure of the problem based on recent ED and inpatient admissions. To this we may add utilization at nearby facilities, but the data is not available at present.

At San Jacinto Methodist Hospital in 2011 there were 443 ED admissions with a primary diagnosis of a Mental Health condition, (187 were self-pay and Medicaid) resulting in a financial loss of $119k. At The Methodist Hospital there were 612 ED admissions with a primary diagnosis of a Mental Health condition resulting in a loss of $1.154M. At Methodist Willowbrook Hospital there were 160 ED admissions with a primary diagnosis of a Mental

Health condition resulting in a loss of $6k. This may be an underestimate since it only captures primary diagnoses. There were 709 behavioral health admissions, 296 of which were self-pay and Medicaid, for a net financial loss of $324k.
It is estimated that 30-50% are readmitted within a one-year period based on national literature. Outpatient Service Availability is limited, and so we hope to leverage the community mental health workers to connect and encourage care within existing primary care and mental health resources. The program could advocate primary care expansion for mental health, through the use of treatment algorithms and perhaps by embedding counselors within a primary practice who could bill "incident to" for supervised service.

Rationale:

As referenced above, residents of Harris County have difficulty accessing mental health services.

The stated principles of the Harris County behavioral health system include quick, easy and convenient entry into services, full range of services and minimal financial barriers to necessary services. The principles promote recovery, continuity of care, family integration in care, evidence based care, and where possible co-location of behavioral health and general health care. HC Behavioral Health promotes stability of behavioral health conditions by decreasing relapse of mental illness and substance abuse.
A designated mental health professional provides oversight to the care-management team to provide this collaborative care.[xviii] There are many examples of collaborative care management.[xix],[xx],[xxi]

Project Components:

h. *Develop a cross-continuum team comprised of clinical and administrative representatives from acute care, ambulatory care, behavioral health and community-based non-medical supports*
   a. *We will develop a team of clinical leaders from various care settings to ensure care delivery is integrated and coordinated.*
i. *Conduct an analysis of the key drivers of 30-day hospital readmissions for behavioral health conditions using a chart review tool*
   a. *We will review each chart and develop a trending report of complications from each patient who is readmitted. Our teams will use this information to ensure we are incorporating the appropriate care pathways while the patients are in the hospital and we will also make any changes to our discharge planning process as needed to reduce readmissions.*
j. *Identify baseline mental health and substance abuse conditions at high risk for readmissions*
   a. *We will begin with a retrospective review of all behavioral health related readmissions to identify trends. On a go-forward basis, we will review each chart and develop a trending report of complications from each patient who is readmitted. These reports will be updated to ensure we are identifying those patients who are at high risk for readmissions.*
k. *Review best practices for improving care transitions from a range of evidence-based or evidence-informed models*
   a. *Our teams will work collaboratively with other groups focused on reducing readmissions and incorporate their best practices to our patient population.*

l. *Identify and prioritize evidence-based strategies and clinical protocols that support seamless care transitions and reduce preventable 30-day readmissions.*
    a. *Our teams will utilize the plan, do, check, act approach of continuous quality improvement for this project. Using this approach will ensure that we are identifying and prioritizing care transactions and reduce readmissions.*

m. *Implement two or more pilot intervention(s) in care transitions targeting one or more patient care units or a defined patient population.*

n. *Conduct quality improvement for project using methods such as rapid cycle improvement.*

The project will focus primarily on items b, c, d and e of the above listed components.

Unique community need identification number the project addresses: CN.3 - Inadequate access to behavioral health care

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project represents the first time a focused, coordinated care navigation effort has been targeted at patients who suffer from behavioral health conditions. We feel that this project will significantly reduce unnecessary emergency department utilization & repeat admissions into inpatient psychiatric units.

Related Category 3 Outcome Measures:
OD-1: Primary Care and Chronic Disease Management
IT-1.18 Follow-Up After Hospitalization for Mental Illness- NQF 0576236 (Standalone measure)
Reasons/rationale for selecting the outcome measures:
Rationale for choice of using one standalone measure is that is most specific for the intervention. It has been well established that unnecessary readmissions can be prevented by implementing various measures to ensure outpatient follow-up.[xxii]
Rate 1: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 30 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.
Our goal is that by year four we will have 60% with follow up within 30 days, and by year 5 we will have 80%.
Rate 2: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 7 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.
As it is difficult to arrange appointments so close to discharge because of patient and physician factors, our goal is that by the fourth year we will have 40% follow up within seven days and by the fifth year, 50%.
Relationship to other Performing Providers Projects within the RHP:
The behavioral health crisis in Region 3 is considerable and the proposed initiatives in our RHP plan will only imply a small impression into the overall community need for treatment, but is a good start. The outpatient focus of many RHP Plan initiatives will help numerous facilities focus

to treating the patients in an ambulatory setting as well as continued navigation of services with a focus to keeping patients from the inpatient unit. This initiative is similar to many others in the sense of the category of behavioral health. The Region 3 Initiative Grid attached in the addendum will show the relationship to other programs.

Multiple other Behavioral Health Innovations include care navigators, transition coaches, or case managers. We seek to participate in lessons-learned with all of these programs. We also plan to collaborate with entities receiving Federal SAMSHA funding such as Community Mental Health services block grant, Substance Abuse Prevention and Treatment Block Grant or other mental health and substance abuse grants, (Harris County Adult Treatment STAR Drug Courts, TI021529). The transition nurse would be reaching out to connect the patient with right source of care.

Plan for Learning Collaborative:

We plan to participate in a region-wide learning collaborative as offered by the anchor for Region 3, Harris Health System. Our participation in this collaborative with other performing providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's health care system.

Project Valuation:

All milestones and metrics were given equal weight and valuation for this project based on our Pass 1 workbook.

The University of Texas Health Science Center - Houston

Pass 1

Project Option 2.1.3- 2.1 Enhance/Expand Medical Homes: UT Health Regional Specialty Care Centers

Unique RHP Project ID: 111810101.2.1
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
The UT medical homes will include services in the areas of dentistry, womens' health, maternal-fetal health, trauma and rehabilitation, sports medicine/orthopedics, behavioral and mental health, cardiovascular diseases, neurosceinces, pediatrics and geriatrics. This Multispecialty Physician Group will provide an extensive network of specialty support centers for primary care providers, built on the concept of an "advanced medical home". Patients will be assigned to a primary care provider within the UT Physicians system of primary and specialty care physicians.

Need for the project:
In our region there is inadequate access to primary care, insufficient access to care coordination practice management and integrated care treatment programs, and lack of access to programs providing health promotion education, training and support. Medical Home models provide accessible, continuous, coordinated and comprehensive patient-centered care that is managed centrally by a primary care physician with the active involvement of non-physician practice staff.

Target Population:
The service areas of our 4 outlying clinics include health professional shortage areas, and medically underserved areas and populations. In FY 2012, UTP provided 321,716 patient visits and expects to add another 80,000 (most, of which are expected to be Medicaid clients) by DY5 for over 400,000 patient visits. Using the Harris County rate (14.5%) of Medicaid clients, there are an estimated 1,423,176 Medicaid clients living within our service areas.

Category 1 or 2 expected patient benefits:
By DY4 the aim will be to improve the number of eligible patients that are assigned to the medical homes, and by DY5 to increase number or percent of enrolled patients' scheduled primary care visits that are at their medical home.

Category 3 outcomes:
IT-6.1 (1): Our goal is to improve by 3% in DY4 and 5% in DY5, the percent improvement over baseline of patient satisfaction scores for getting timely care, appointments, and information (using the supplemental module for the adult CG-CAHPS survey) for patients of UT Physician Clinics, who are not cancer surgery patients and who were assigned to a medical home.

Project Option 2.1.3 – Enhance/Expand Medical Homes: C1-2 UT Health Regional Specialty Care Centers

Unique RHP Project Identification Number: 111810101.2.1
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 2.1 Enhance/Expand Medical Homes (Option 2.1.3)

The practice at UT Physicians' Clinics serves areas designated as primary care health professional shortage areas (HPSAs), medically underserved areas (MUAs), and medically underserved populations (MUPs). The Bayshore Clinic service area includes several HPSAs (CT 3207, CT 3208, CT 3218, CT 3219, CT 3220, CT 3333). The Bellaire Clinic service area includes several MUPs (CT 4211, CT 4213, CT 4214, CT 4215, CT 4216). Also, the Cinco Ranch Clinic (CT 6731, CT 6733) and the Sienna Clinic (CT 6746) service areas include MUAs. The practice at UT Physicians' clinics will be transformed to operate on the concept of patient-centered medical homes. The medical homes will include services in the areas of dentistry, womens' health, maternal-fetal health, trauma and rehabilitation, sports medicine/orthopedics, behavioral and mental health, cardiovascular diseases, neurosceinces, pediatrics and geriatrics. UT Health already has and/or will establish state-of-the-art top-ranking Regional Centers in Dental Health, Maternal-Fetal Health, Women, Child and Adolescent Health, Healthy Aging, Neurosciences, Sports Medicine, Trauma and Rehabilitation, Behavioral and Mental Health, Heart and Vascular Disorders and Students' Health. This Multispecialty Physician Group will provide an extensive network of specialty support centers for primary care providers, built on the concept of an "advanced medical home".

Patients will be assigned to a primary care provider within the UT Physicians system of primary and specialty care physicians. Members of staff will be placed into multidisciplinary care teams that manage a panel of patients; each with a defined role and tasks would be divided among care team members to reflect the skills, abilities, and credentials of team members. Patients will be linked to a provider and care team so both patients and provider/care team recognizes each other as partners in care. By means of phone, e-mail, or in-person visits, patients will have continuous access to their medical home. This program will rely on the National Committee for Quality Assurance (NCQA) guidelines (http://www.ncqa.org/Portals/0/Programs/Recognition/RPtraining/PPCPCMH_Training.pdf), which include: 1. improved access and communication, 2. use of data systems to enhance safety and reliability, 3. care management, 4. patient self-management support, 5. electronic prescribing, 6. test tracking, 7. referral tracking, 8. performance reporting and improvement, and 9. advanced electronic communications. (See related project MS1 UT-Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center, and projects C5-C9 and CL3 for chronic disease management programs for asthma, COPD, CHF, diabetes, and hypertension.) Finally, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:

Project Goal:

To provide a primary care "home base" for patients, who will be assigned a health care team that tailors services to their unique health care needs, effectively coordinates their care across inpatient and outpatient settings, and proactively provides preventive, primary, routine and chronic care.

This project addresses the following regional goal:

Redesigning of the practice at UT Health on the PCMH concept fits right with the regional goal to "transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system."

Challenges:

Need: 1) Inadequate access to primary care. 2) Insufficient access to care coordination and integrated care treatment programs. 3) Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs.

Implementation: 1) Staff motivation and ability to work as a care team. 2) Availability of manpower to implement staffing plan.

With the Medical Homes project patients will have access to comprehensive care in a coordinated manner, including preventive and self-management education programs. Providers will be assembled to work in teams to deliver personalized and effective care to enrolled patients.

5-Year Expected Outcome for Provider and Patients:

Our practice will have been transformed based on the concept of the patient centered medical homes, leading to better coordination of patient care, increased acccess, and improved patient satisfaction. In addition to benefiting the current Medicaid (23% as of 2011, or 65,302 patient visits) and low-income client base of UTP clinics, this model of care will be available to another potential 1,423,176 Medicaid and Medicaid-eligible residents living within the service areas of the UT Physician Clinics, to whom our services will be marketed. With the expansion of primary and specialty care access, we expect to provide patient care to an additional 80,000 patient visits by the end of DY5, most of which are expected to be Medicaid/Medicaid-eligible clients (based on the demographics of the UTP clinics service areas). The transition to the team-based, proactive healthcare delivery model of medical homes, all conveniently located where there is great need, will help to address many of the barriers that the low-income population typically encounter in getting the appropriate care, facilitating better health outcomes.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

A Patient Centred Medical Home is designed to provide a single point of coordination for all health care, including primary care, specialty care, hospital, and post-acute care. Medical Home models provide accessible, continuous, coordinated and comprehensive patient-centered care and are managed centrally by a primary care physician with the active involvement of non-physician

practice staff. The model is based on the reasoning that care coordination can reduce fragmentation in patient care in ways that lower costs and lead to better overall patient outcomes. (O'Mallley, A., Peikes, D., & Ginsburg, P. (2008). "Making Medical Homes Work: Moving from Concept to Practice & Qualifying a Physician Practice as a Medical Home." Policy Perspective 1:1-19. Bailit, M. and C. Hughes. "The Patient-Centered Medical Home: A Purchaser Guide." Patient Centered Primary Care Collaborative. 2008. Rosenthal, T. (2008). "The Medical Home: Growing Evidence to Support a New Approach to Primary Care." Journal of the American Board of Family Medicine 21 (5): 427-440.) By providing the right care at the right time and in the right setting, over time, patients may see their health improve, rely less on costly ED visits, incur fewer avoidable hospital stays, and report greater patient satisfaction.

Project Components:

Through the UT Health Regional Specialty Care Centers Program, we propose to meet all required project components listed below.

a) UTP will develop and implement policies and systems to enhance patient access to the medical home. This enhanced access will include open scheduling, expanded hours to include evening and Saturday hours, a new online patient portal, and the ability for patients to communicate with their healthcare team via email.
b) Based on staff capacity, demographics, and diseases, practice supply and demand, UTP will determine the appropriate panel size for primary care provider teams and assign patients to a primary care provider within the medical home.
c) UTP will restructure the current organization of care into multidisciplinary care teams that will manage a panel of patients where providers and staff operate at the top of their license. Roles and tasks of care team members will reflect their skills, abilities, and credentials.
d) UTP will link patients to a provider and care team so both patients and provider/care team recognizes each other as partners in care.
e) Using the enhanced access policies and systems, UTP will assure that patients are able to see their provider or care team whenever possible. By promoting the expanded access available through the medical home model (open scheduling, nurse advise line, the online patient portal, and email contact with the care team) established patients will have 24/7 continuous access to their care teams.
f) UTP's quality improvement office will conduct QI for each of the clinics providing specialty care using methods such as rapid cycle improvement.

Milestones and Metrics:

For the UT Health Regional Specialty Care Centers Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

<u>Process Milestones and Metrics</u>:

Milestone 1 [P-2.]: Put in place policies and systems to enhance patient access to the medical home. Enhanced access to care is available through systems such as open scheduling, expanded hours and new options for communication between patients, their personal physician, and practice staff.

Metric 1 [P-2.1.]: UT Physicians policies on medical home

Milestone 2 [P-5.]: Determine the appropriate panel size for primary care provider teams, potentially based on staff capacity, demographics, and diseases.
Metric 1 [P-5.1.]: Determine Panel size
Milestone 3 [P-4.]: Develop staffing plan to expand primary care team roles; Expand and redefine the roles and responsibilities of primary care team members.
Metric 1 [P-4.1.]: Expanded primary care team member roles
Milestone 4 [P-3.]: Reorganize staff into primary care teams responsible for the coordination of patient care.
Metric 1 [P-3.1.]: Primary care team
Milestone 5 [P-9.] : Train medical home personnel on PCMH change concepts.
Metric 1 [P-9.1.]: Number of medical home personnel trained

Improvement Milestones and Metrics:

Milestone 6 [I-12.]: Based on criteria, improve the number of eligible patients that are assigned to the medical homes.
Metric 1 [I-12.1.]: Number or percent of eligible patients assigned to medical homes, where "eligible" is defined by the UT Physicians
Milestone 7 [I-16.]: Increase number or percent of enrolled patients' scheduled primary care visits that are at their medical home
Metric 1 [I-16.1.]: Percent of primary care visits at medical home

Unique community need identification numbers the project addresses:

This project addresses community needs CN.1 (Inadequate access to primary care), CN.7 (Insufficient access to care coordination practice management and integrated care treatment programs), and CN.20 (Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project represents a new initiative. UT Physicians practice is not currently organized on the medical home model. Hence, UT Physicians proposes to provide better coordinated care for its patients by transitioning to a patient-centered and team-based model of care.

Related Category 3 Outcome Measure(s):

OD-6 Patient Satisfaction

- IT-6.1 (1) Percent improvement over baseline of patient satisfaction scores (1) are getting timely care, appointments, and information (stand alone measure)

Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a stand-alone measure). Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients: (1) are getting timely care, appointments, and information (already established patients at UTP Clinics, who are not cancer surgery patients and who were assigned to a medical home)

Relationship to other Projects:

1.1 (C3) - The expanded capacity to deliver primary care will be necessary for the redesign of the UT Physician practice as patient-centered medical homes, ensuring that there are enough primary care physicians for patient panels.
1.2 (A2, SPH1) - The innovative residency program and the training of community health workers will ensure availability of human resources to staff the medical homes.
1.3 (C12) - The disease management registry will be a useful resource for efficient medical home assignment and disease management within the medical homes.
1.7 (A1) - Telemedicine increases the capacity of UT Medical Homes to deliver both primary and specialty care services to patients when and where needed.
1.10 (MS1) - With QI support from project MS1, UT Health will be better equipped to deliver optimum care to patients.
2.2 (C5-9,CL3)- A significant number of patients seen regularly in primary care have chronic diseases requiring more effective care for patients enrolled in UT Medical Homes, for which the chronic care model is well suited.
2.9 (A4) - The care navigation project will facilitate the move into a primary care setting for frequent ED users by getting them enrolled in primary care within the UT Medical Homes.
2.11 (C10) - The medication management program will be a useful resource for all care providers in the UT Medical Homes practice.
2.12 (A3, CL1, CL2, MS4) - The various care transitions projects will ensure there is no interruption in the care continuum for patients as they transit from one form of care to the other within the medical homes .

Relationship to Other Performing Providers' Projects in the RHP:

Primary Care/Ambulatory Care clinics are a top priority to Region 3 due to the acuity of the regional patient mix, population concentration, and lack of primary care access points for our patient base. The regional approach of collaboration as well as existing patient referral pattern relationships allowed our team to properly identify the community needs based on the necessity of population, uninsured, and medically underserved patient bases. This program is consistent with our region and similar to numerous initiatives in our RHP plan sharing both concepts as well as outcome measures focused to percent improvement over baseline of patient satisfaction scores, reduction of inappropriate ED utilization, and third next available appointment status. The Region 3 Initiative Grid attached as a RHP Plan addendum reflects a grid of relationship for all initiatives.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for

that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **6**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **5**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.2.1 X 2 = **4**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **2**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **3.3**

Project Option 2.2.1- 2.2 Expand Chronic Care Management Models: Redesign the Outpatient Delivery System of Harris Health to Coordinate Care for Patients with Chronic Diseases

Unique RHP Project ID: 111810101.2.2
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
The outpatient delivery system of UT Physicians will be redesigned to coordinate care for patients with chronic diseases (asthma, CHF, COPD, diabetes, and hypertension), based on Wagner's chronic care model and using evidence-based standards of care for each of the targeted diseases.

Need for the project:
There are high rates of chronic diseases in our population. Because chronic care requires ongoing interaction between patients and the health system, there often arises challenges in care coordination. The evidence-based Chronic Care Model summarizes the basic elements for improving care of chronic disease patients, and there is need to apply such a model, if care outcomes are to be improved for patients with these conditions.

Target Population:
This project targets people in our service area with diabetes, hypertension, asthma, COPD, or CHF. Patients of lower socioeconmic status (which number approximately 448,583 for the UTP clinics service areas) are known to have worse disease control due to the inability to maintain compliance in the long run, hence this project will be beneficial to the Medicaid population in the UTP clinics service areas.
Category 1 or 2 expected patient benefits:
Our DY4 goal is to increase the number of addtional patients receiving care under the Chronic Care Model for Asthma, COPD, CHF, Diabetes, and Hypertension. The DY5 goal is to improve the percentage of patients with targeted chronic diseases that have self-management goals.
Category 3 outcomes:
IT-9.2: Our goal is to reduce by 3% in DY4 and 5% in DY5, the percentage of Emergency Department visits for asthma, COPD, CHF, Diabetes, and Hypertension.

Project Option 2.2.1 – Expand Chronic Care Management Models: C5-9,CL3 Redesign the Outpatient Delivery System of UT Physicians to Coordinate Care for Patients with Chronic Diseases

Unique RHP Project Identification Number: 111810101.2.2
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 2.2 Expand Chronic Care Management Models (Option 2.2.1)

Almost half of all Americans live with a chronic condition, and almost half of all people with chronic illness have multiple conditions. This also the situation in our region, as our community needs assessment shows that there are high rates of chronic diseases in our population, including asthma, CHF, COPD, diabetes, and hypertension. Because chronic care requires ongoing interaction between patients and the health system, there often arises challenges in care coordination. The evidence-based Chronic Care Model (Coleman et al. Evidence On The Chronic Care Model In The New Millennium, Health Affairs 28, no. 1 (2009): 75–85; 10.1377/hlthaff.28.1.75), summarizes the basic elements for improving care of chronic disease patients, and there is need to apply such a model, if care outcomes are to be improved for patients with these conditions.

The outpatient delivery system of UT Physicians will be redesigned to coordinate care for patients with chronic diseases (asthma, CHF, COPD, diabetes, and hypertension), based on Wagner's chronic care model (CCM) and using evidence-based standards of care as follows: The National Asthma Education and Prevention Program Expert Panel Report 3 guidelines, The National Institute for Clinical Excellence (NICE) COPD clinical guidelines, The Heart Failure Model of Care guidelines, The American Diabetes Association (ADA) Standards of Medical Care in Diabetes, and the JNCVII guidelines for hypertension. Wagner's CCM identifies the essential elements of a health care system that encourage high-quality chronic disease care; these are self-management support, delivery system design, decision support, clinical information systems, and the community. Evidence-based change concepts under each element, in combination, foster productive interactions between informed patients who take an active part in their care and providers with resources and expertise. Reforms to be implemented using this model include: designing and implementing care teams (including non-physician health professionals) that are tailored to the patient's health care needs, scheduling of next appointment before patient leaves office, use of appointment reminders, follow up of patients who missed appointments, regular review of all medications from all sources, ensuring patients can access their care teams by phone or email as well as access their medical information through an electronic patient portal, and referral of selected patients for more intensive counseling. Also, regular disease self-management education and support sessions will be provided free of charge to patients of Harris Health, and this will be tailored to the literacy levels and cultures of the patients.

Finally, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:

Project Goal:

To develop and implement chronic disease management interventions that are geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization.

This project addresses the following regional goal:

The implementation of the chronic care management model will ensure better outcomes for patients with chronic diseases, which is in line with the regional goal to "transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system."

Challenges:

Need: 1) High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease. 2) Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs

Implementation: 1) Willigness of physicians to transit to a 'team-based' model of care that gives greater roles to other providers. 2) Low health literacy levels and low economic resources can influence patients' ability to be effective partners in their own care.

With training on the chronic care model and its application to chronic care, physicians and other providers will be better motivated to work as a team to deliver proactive care that keeps chronic disease patients stable and without a need for urgent care. The care team will also be made up of support personnel that will provide education and other support services that will help to assist patients in overcoming barriers to their participation in self-care.

5-Year Expected Outcome for Provider and Patients:

Successful implementation of the chronic care model will lead to better monitoring by the patient's care team and increased patient engagemment in self-care, thereby reducing the need for acute episodic care. In addition to benefiting the current Medicaid (23% as of 2011, or 65,302 patient visits) and low-income client base of UTP clinics, this model of chronic care management will be available to another estimated 80,000 patient visits (due to UTPs primary and specialty care expansion projects), most of which are expected to be Medicaid clients (based on the demographics of UTP clinics service areas and the additional 1,423,176 Medicaid and Medicaid-eligible residents living within these specific areas). This project will benefit all Medicaid and low-income clients in addressing many of the barriers encountered in being compliant with chronic disease management plans, facilitating better health outcomes. Improved patient compliance is expected to produce a decrease in ED usage for the chronic diseases targeted.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

Asthma is increasing every year in the US; the proportion of people with asthma in the United States grew by nearly 15% in the last decade. There are significant disparities in asthma prevalence in the US. Adults with an annual household income of $75,000 or less are more likely to have asthma than adults with higher incomes. (Asthma's Impact on the Nation: Data from the CDC National Asthma Control Program. Available at: http://www.cdc.gov/asthma/ impacts_nation/AsthmaFactSheet.pdf. Accessed 10/15/12). People with asthma can often prevent asthma attacks if they are taught to use inhaled corticosteroids and other long-term control medicines correctly and to avoid asthma triggers. In 2008 less than half of people with asthma reported being taught how to avoid triggers. (CDC 2011: Asthma in the US. Available at: http://www.cdc.gov/vitalsigns/Asthma/#. Accessed 10/15/12).

Chronic lower respiratory diseases, primarily COPD, are the third leading cause of death in the United States, and 5.1% of U.S. adults report a diagnosis of emphysema or chronic bronchitis (Morbidity and Mortality Weekly Report (MMWR) March 2, 2012 / 61(08);143-146. Available at: http://www.cdc.gov/mmwr/preview/mmwrhtml/mm6108a3.htm?s_cid=mm6108a3_w. Accessed 10/15/12). Excess health-care expenditures are estimated at nearly $6,000 annually for every COPD patient in the United States (Deaths from Chronic Obstructive Pulmonary Disease - United States, 2000--2005. November 14, 2008 / 57(45);1229-1232. Available at: http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5745a4.htm. Accsessed 10/15/12). Uncontrolled COPD leads to deterioration in lung function and eventually death.

Around 5.8 million people in the United States have heart failure and about 670,000 people are diagnosed with it each year. About one in five people who have heart failure die within one year from diagnosis but early diagnosis and treatment can improve quality of life and life expectancy for people who have heart failure. Heart failure results in significant costs to the system; it cost the US nearly $40 billion in 2010 (CDC 2010: healrt failure facts. Available at: http://www.cdc.gov/dhdsp/data_statistics/fact_sheets/docs/fs_heart_failure.pdf. Accessed on 10/15/12).

Uncontrolled diabetes can result in complications with dire consequences for the patient. For example, the risk of stroke is 2 - 4 times higher among people with diabetes; diabetes is the leading cause of new onset blindness among adults aged 20 - 74 years in the US; nearly half of all cases of kindey failure can be attributed to diabetes; and more than half of all caes of nontraumatic lower limb amputations are because of poorly controlled diabetes. Diabetes also predisposes patients to dental diseases, pregnancy complications, among other problems. Studies in the United States have shown that improved glycemic control benefits people with either type 1 or type 2 diabetes. In general, every percentage point drop in HbA1c blood test results (e.g., from 8.0% to 7.0%) can reduce the risk of microvascular complications (eye, kidney, and nerve diseases) by 40%.

In 2009-2010, the age-adjusted percentage of US adults with hypertension whose blood pressure was contolled was 53.3%. Hypertension is a leading cause of stroke, coronary artery disease, heart attack, and heart and kidney failure in the United States, all of which contribute to the rising costs of health care. Aggressive treatment of hypertension significantly decreases the risk of coronary artery disease, congestive heart failure, stroke, and resulting disability. Low-income individuals without prescription drug coverage are significantly more likely to skip doses to save money or make their hypertension medication prescriptions last longer. (Rein DB, Constantine RT, Orenstein D, Chen H, Jones P, Brownstein JN, et al. A cost evaluation of the Georgia Stroke and Heart Attack Prevention Program. Prev Chronic Dis [serial online] 2006 Jan

[date cited]. Available from: URL: http://www.cdc.gov/pcd/issues/2006/jan/05_0143.htm. Accessed on 10/15/12).

Project Components:

Through the Redesign the Outpatient Delivery System of Harris Health to Coordinate Care for Patients with Chronic Diseases Program, we propose to meet all required project components listed below.

a) UTP will design and implement care teams that are tailored to the health care needs of patients with asthma, COPD, CHF, diabetes, and hypertension.
b) UTP care teams will include non-physician health professionals, such as pharmacists, case managers, nutritionists, health educators, and health coaches.
c) In addition to accessing their care team by appointment, patients will have 24/7 continuous access to their care teams wherever possible via expanded access points such as open scheduling, the nurse advise line, the online patient portal, and email.
d) Patient engagement will be further increased through patient education, group visits, self-management support, and coordination with community resources. UTP will empower patients to make lifestyle changes to stay healthy and manage their chronic conditions.
e) UTP's quality improvement office will conduct QI for each of the clinics providing specialty care using methods such as rapid cycle improvement.
f) UTP will monitor project impacts and identify opportunities to expand the project to broader patient populations, including safety-net populations.

Milestone and Metrics:

For the Redesign the Outpatient Delivery System of Harris Health to Coordinate Care for Patients with Chronic Diseases Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-3.]: Develop a comprehensive care management program for asthma, COPD, CHF, Diabetes, and Hypertension.

Metric 1 [P-3.1.]: Documentation of Care management program. The Wagner Chronic Care Model will be utilized in program development.

Milestone 2 [P-2.]: Train staff in the Chronic Care Model, including the essential components of a delivery system that supports high-quality clinical and chronic disease care for Asthma, COPD, CHF, Diabetes, and Hypertension.

Metric 1 [P-2.1.]: Increase percent of staff trained

Milestone 3 [P-4.]: Formalize multi-disciplinary teams, pursuant to the chronic care model defined by the Wagner Chronic Care Model.

Metric 1 [P-4.1.]: Increase the number of multi-disciplinary teams (e.g., teams may include physicians, mid-level practitioners, dieticians, licensed clinical social workers, psychiatrists, and other providers) or number of clinic sites with formalized teams.

Improvement Milestones and Metrics:

Milestone 4 [I-17.]: Apply the Chronic Care Model to targeted chronic diseases, which are prevalent locally.

Metric 1 [I-17.1.]: X additional patients receive care under the Chronic Care Model for Asthma, COPD, CHF, Diabetes, and Hypertension.

Milestone 5 [I-18.]: Improve the percentage of patients with targeted chronic diseases that have self-management goals.
Metric 1 [I-18.1.]: Patients with targeted chronic diseases with self-management goals.

Unique community need identification numbers the project addresses:
This project addresses community needs CN.11 (High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease) and CN.20 (Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project represents a new initiative. UT Physicians proposes to provide chronic care management to its patients with chronic diseases, based upon Wagner's Chronic Care Model, which is a comprehensive, pro-active, patient-centered model of care.

Related Category 3 Outcome Measure(s):
OD-9 Right Care, Right Setting

- IT-9.2 ED appropriate utilization (Stand-alone measure)

Reduce Emergency Department visits for Asthma, COPD, CHF, Diabetes, Hypertension

Relationship to other Projects:

1.1 (C3) - Expanded capacity in primary care will ensure the availability of staff to implement the expansion of the chronic care management model for patients with asthma.
1.2 (A2, SPH1) - Part of the innovative training of primary care providers will be centered on the chronic care model with emphasis on team-based practice.
1.3 (C12) - The disease management registry (Information Technology support) is a very important component of Wagner's Chronic Care Model.
1.7 (A1) - Telemedicine will help to ensure that chronic care patients will get specialist input into their care when and where needed.
1.9 (C4) - Also, the expansion of specialty care in the primary care setting will help to ensure that chronic care patients will get specialist input into their care when and where needed.
1.10 (MS1) - The QI project will aid in the adoption of a 'whole systems' approach to chronic management, enabling the implementation of a comprehensive and proactive approach to chronic care in which the patient is kept in continuos contact with the care team.
2.1 (C1) - The expansion of chronic care management models will ensure more effective care for patients enrolled in UT Medical Homes.

Relationship to Other Performing Providers' Projects in the RHP:

Healthcare costs are significantly increased within a patient base with such aggressive chronic conditions that have gone untreated. The initiatives focused to chronic disease management focus to conditions such as asthma, hypertension, and diabetes and are similar in the approach of managing & proactively treating chronic conditions in order to reduce 30-day readmission rates, inappropriate emergency department utilization, and healthcare costs. The

Region 3 Initiative grid allows a cross reference of initiatives associated with chronic disease management. (addendum)

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criteria were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **4**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **4**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.2.2 X 2 = **4**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **2**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **2.7**

Project Option 2.9.1- 2.9 Establish/Expand a patient Care Navigation Program: UTHealth Regional Patient Navigation

Unique RHP Project ID: 111810101.2.3
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
This project target patients at high risk of disconnect from institutionalized health care; specifically, patients that entered Memorial Hermann Hospital-TMC through the emergency department (ED). Care navigators will support these patients to navigate through the continuum of health care services, ensuring that patients receive coordinated, timely, and site-appropriate health care services.

Need for the project:
Our region has high rates of inappropriate use of the ED and there is a lack of patient navigation, patient and family education and information programs. Frequent ED users do so for various reasons that often include inability to afford care, lack of knowledge on how to navigate the health care system, poor access to good quality primary care, and so on. Care navigators can help patients and their families navigate the fragmented maze of doctors' offices, clinics, hospitals, out-patient centers, payment systems, support organizations and other components of the healthcare system.

Target Population:
Patients that enter Memorial Hermann Hospital-TMC through the ED.

Category 1 or 2 expected patient benefits:
Our DY4 goal is to increase the percent of patients without a primary care provider (PCP) who received education about a PCP while in the ED, and by DY5 to increase the percent of patients without a PCP who are given a scheduled primary care provider appointment.

Category 3 outcomes:
IT-3.9: Our goal is to reduce by 3% in DY4 and 5% in DY5, the percentage of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index COPD admission.

Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program: A4 UTHealth Regional Patient Navigation

Unique RHP Project Identification Number: 111810101.2.3
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 2.9 Establish/Expand a Patient Care Navigation Program: (Option 2.9.1)

A patient care navigation program will be designed and implemented within the UT Health system of medical homes. The program will target patients at high risk of disconnect from institutionalized health care. Specifically, patients that entered Memorial Hermann Hospital-TMC through the ED, and then referred from the UT Health Hospitalist Service, will be sought after by the care navigators. Care navigators - community health workers (CHWs) - recruited and trained to deliver culturally competent care will assist the patients in linking up with a primary care provider within the UT Health medical homes. The patient navigators will help and support these patients to navigate through the continuum of health care services, ensuring that patients receive coordinated, timely, and site-appropriate health care services, by assisting in connecting patients to primary care physicians and/or medical home sites, as well as diverting nonurgent care from the Emergency Department to site-appropriate locations. By linkage with primary care, these patients will also be given access to chronic-disease self-management programs as deemed appropriate. Finally, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:

Project Goal:

Help and support patients especially in need of coordinated care navigate throught the continuum of health care services so that patients can receive coordinated, timely services when needed with smooth transitions between health care settings.

This project addresses the following regional goal:

The care navigation project will make it easier for patients to access the right care in the right place, thereby attaining the regional goal to "transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services..."

Challenges:

Need: 1) High rates of inappropriate emergency department utilization. 2) Lack of patient navigation, patient and family education and information programs.

Implementation: 1) Access to Memorial Hermann Hospital ED data. 2) Recruitment and retention of care navigators.

UT Physicians have had good working relationship with the Memorial Hermann Hospital System and this project will enable further collaboration to tackle one of the greatest challenges of the US health care system - inappropriate emergency department use.

5-Year Expected Outcome for Provider and Patients:

We expect to achieve increased uptake of primary care services by people who tend to rely on the ED for their health care needs. In addition to benefiting the current Medicaid (23% as of 2011, or 65,302 patient visits) and low-income client base of UTP clinics, this project will specifically target patients at high risk of disconnect from institutionalized health care that enter the healthcare system via the Memorial Hermann Hospital ED. These patients are typically idigent individuals (Medicaid, or Medicaid-eligible) who need additional assistance in maintaining their health via ambulatory care settings. While we expect to see improved outcomes for these patients in a number of conditions, we will be measuring 30 day readmission rates for discharges with an index COPD admission.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

Our region has high rates of inappropriate use of the ED. Frequent ED users do so for various reasons that often include inability to afford care, lack of knowledge on how to navigate the health care system, poor access to good quality promary care, and so on. Care navigators can help patients and their families navigate the fragmented maze of doctors' offices, clinics, hospitals, out-patient centers, payment systems, support organizations and other components of the healthcare system. There are different kinds of services that could be offered by navigators and this may include: setting up contacts with primary care, facilitating communication among patients, family members, survivors and healthcare providers, coordinating care among providers, arranging financial support and assisting with paperwork, and facilitating follow-up appointments.

Community health workers have close ties to the local community and serve as important links between underserved communities and the healthcare system, hence they will amke excellent care navigators. They also possess the linguistic and cultural skills needed to connect with patients from underserved communities.

Project Components:

Through the UTHealth Regional Patient Navigation Program, we propose to meet all required project components listed below.

a) UTP will work with Memorial Hermann Hospital (MHH) and the UT School of Public Health to conduct a needs assessment to identify the patient population(s) to be targeted with the Patient Navigator program (frequent ED users, including those at risk of disconnect from institutionalized ambulatory care). Those patient population(s) identified will be targeted for our preventable ED reduction program using trained health care navigators.
b) UTP will work with MHH to establish a health care navigation program to provide support to patient populations who are most at risk of receiving disconnected and fragmented care.

c) UTP and MHH will collaborate to provide appropriate training for navigators, which will include case managers/workers, community health workers, and other types of health professionals.
d) Navigators will be deployed to connect patients to primary and preventive care in the UT Physicians medical homes, or the Memorial Hermann Medical Group's pediatric practices (staffed and managed by UT Physicians) to increase access to care management, including education in chronic disease self-management.
e) UTP's quality improvement office will conduct QI for each of the clinics providing specialty care using methods such as rapid cycle improvement.

Milestones and Metrics:

For the UTHealth Regional Patient Navigation Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

<u>Process Milestones and Metrics</u>:

Milestone 1 [P-1.]: Conduct a needs assessment to identify the patient population(s) to be targeted with the Patient Navigator program.

Metric 1 [P-1.1.]: Provide report identifying the following:

- Targeted patient population characteristics (e.g., patients with no PCP or medical home, frequent ED utilization, homelessness, insurance status, low health literacy).
- Gaps in services and service needs.
- How program will identify, triage and manage target population (i.e. Policies and procedures, referral and navigation protocols/algorithms, service maps or flowcharts).
- Ideal number of patients targeted for enrollment in the patient navigation program
- Number of Patient Navigators needed to be hired
- Available site, state, county and clinical data including flow patients, cases in a given year by race and ethnicity, number of cases lost to follow-up that required medical treatment, percentage of monolingual patients

Milestone 2 [P-2.]: Establish a health care navigation program to provide support to patient populations who are most at risk of receiving disconnected and fragmented care including program to train the navigators, develop procedures and establish continuing navigator education.

Metric 1 [P-2.1.]: Number of people trained as patient navigators, number of navigation procedures, or number of continuing education sessions for patient navigators.

<u>Improvement Milestones and Metrics</u>:

Milestone 3 [I-6.]: Increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services.

Metric 1 [I-6.2.]: Percent of patients without a primary care provider (PCP) who received education about a primary care provider in the ED

Milestone 4 [I-6.]: Increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services.

Metric 1 [I-6.4.]: Percent of patients without a primary care provider who are given a scheduled primary care provider appointment

Unique community need identification numbers the project addresses:

This project addresses community needs CN.8 (High rates of inappropriate emergency department utilization) and CN.23 (Lack of patient navigation, patient and family education and information programs).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project represents a new initiative. This program does not currently exist in the UT Physicians and Memorial Hermann Hospital-TMC system. This project proposes to target patients at high risk of disconnect from institutionalized health care with an intervention for getting them into primary care settings, where they can receive regularized care and avoid the need for episodic acute care.

Related Category 3 Outcome Measure(s):

OD-3 Potentially Preventable Re-Admissions- 30 day Readmission Rates (PPRs)

- IT-3.9 Chronic Obstructive Pulmonary Disease 30 day readmission rate (Standalone measure)

Numerator: The number of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index COPD admission. If an index admission has more than 1 readmission, only first is counted as a readmission.

Denominator: The number of admissions (for patients 18 years and older), for patients discharged from the hospital with a principal diagnosis of COPD and with a complete claims history for the 12 months prior to admission.

Relationship to other Projects:

1.1 (C3) - Expanded primary care services will ensure there is reserve capacity to handle the increased demand anticipated by the succesful diversion of nonurgent care from the Emergency Department to primary care settings.

1.2 (A2, SPH1) - The SPH1 project will ensure their is sufficient supply of CHWs to serve as care navigators and the training received by residents (A2) will help the physicians understand how to integrate CHWs as members of the health care team.

1.3 (C12) - The disease management registry will enable the identification of patients who default from care so that they can be actively sought and brought into compliance, which will help to reduce frequent ED use.

1.6 (C11)- Navigators will be a resource available to the nurse triage line to help ensure patients get the right care at the right time and and in the right setting.

1.9 (C4) - The expansion of specialty care in the primary care setting will help patient navigators ensure that patients get appropriate specialist input into their care when and where needed.

2.1 (C1-2) - Care navigators will assist frequent ED users in getting enrolled with a primary care team at UT Medical Homes, which will aid in reducing inappropriate ED use.

2.2 (C5-9,CL3) - Getting frequent ED users enrolled in a UT Medical Home, where they can receive guidance and regular evidence-based care for chronic diseases will reduce the need for acute care services being received in the ED.

Relationship to Other Performing Providers' Projects in the RHP:

The ability to properly identify and monitor specific patients with chronic conditions or frequent emergency department utilization trends will allow the region to accurately mange the very large patient base. Patient navigation includes a comprehensive list of tasks as well as unique provider types based on the focus of the initiative and will help the focus of cost containment, emergency department utilization, and chronic disease management. The Region 3 Initiative Grid in the addendum allows for a cross reference of all initiatives proposed within this concept.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **6**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **3**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.2.3 X 2 = **3**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **4**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **3**

Project Option 2.10.1- 2.10 Use of Palliative Care Programs: Integrating Palliative Care into Critical Care

Unique RHP Project ID: 111810101.2.4
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
Patients admitted to any adult ICU at Memorial Herman Hospital-TMC who are at high risk of death in or soon after hospitalization will receive a palliative care consultation to supplement their clinical therapy and assist in determination of goals of care which may include transitioning the patients from acute hospital care into home care, hospice or a skilled nursing facility.

Need for the project:
While end-of-life care was once associated almost exclusively with terminal cancer, today there is need for end-of-life care for a number of other conditions, such as congestive heart failure. In addition to providing improved care and comfort for dying patients and their families, palliative care programs have been shown to provide considerable cost savings.

Target Population:
Patients admitted to any adult ICU at Memorial Herman Hospital-TMC who are at high risk of death in or soon after hospitalization.

Category 1 or 2 expected patient benefits:
Our goal for DY4 is to increase the percentage of hospice or palliative care patients who were screened for pain during the hospice admission evaluation/palliative care initial encounter. For DY5 the goals will be to and to implement a patient/family experience survey regarding the quality of care, pain and symptom management, and degree of patient/family centeredness in care, and to increase the number of palliative care patients transitioned from acute hospital care into hospice, home care, or a skilled nursing facility.

Category 3 outcomes:
IT-13.1: Our goal is to increase by 3% in DY4 and 5% in DY5, the percentage of patients enrolled in hospice OR receiving palliative care who received a comprehensive clinical assessment to determine the severity, etiology and impact of their pain within 24 hours of screening positive for pain on the admission evaluation/initial encounter.

Project Option 2.10.1 – Use of Palliative Care Programs: MS3 Integrating Palliative Care into Critical Care

Unique RHP Project Identification Number: 111810101.2.4
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 2.10 Use of Palliative Care Programs (Option 2.10.1)

The project will entail identifying patients admitted to any adult ICU at Memorial Herman Hospital-TMC who are at high risk of death in or soon after hospitalization. Patients will be screened based on meeting one or more of the following criteria: severe life-threatening acute illness, progressive terminal illness, significant exacerbation of chronic debilitating illness, or declining quality of life and independent functioning in the past 6 months. In collaboration with the primary clinical team, these patients will receive a palliative care consultation to supplement their clinical therapy and assist in determination of goals of care which may include transitioning the patients from acute hospital care into home care, hospice or a skilled nursing facility. Patient/family experience surveys regarding the quality of care, pain and symptom management, and degree of patient/family centeredness in care will also be implemented.

UTHealth will recruit additional physicians trained in palliative care and other team staff to expand the existing palliative care program. The current partnership of UTHealth and Memorial Hermann Hospital-TMC has been a successful program, which is seeing increased demand and needs further expansion. Since the start of the program in 2004, over 1,000 patients have received palliative care related to cancer, heart failure, and various other illnesses, including infants in the NICU. In 2010, palliative care was provided to 84 cancer patients, 467 non-cancer patients, and 25 patients for whom the illness is unknown. In 2011, 203 patients with heart failure (DRGS 291,292, 293) received palliative care. (Data from the UTHealth Medical School, Geriatric & Palliative Medicine Division, Palliative Fact Sheet August 2012.)

Finally, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:

Project Goal:

Patients receive dignified and culturally appropriate end-of-life care, which is provided for patients with terminal illnesses in a manner that prioritizes pain control, social and spiritual care, and patient/family preferences.

This project addresses the following regional goal:

One of the goals of the region is "to develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction". The palliative care project when successfully implemented will make the health system bettr suited to attend to patients' needs at the end-of-life thereby invcreasing satisfaction

Challenges:

Need: 1) Education and information about the dying process and the various options for care. 2) Support and navigation in acting upon their preferences for care.

Implementation: 1) Staff recruitment and retention. 2) Willingness of patients, or their families, to embrace palliative care.

The project will mitigate the challenges patientts and their families face due to lack of access to information to enable informed end-of-life decisions that are satisfactory. Gradually as the program gets establishe, the learning process will enable development of best practices in palliative care and increased likelihood of patients to embrace care options

5-Year Expected Outcome for Provider and Patients:

Increased uptake of palliative care services, greater involvement of patients and/or their families in end-of-life decisions, and increased satisfaction with end-of-life care. These services will be available to the Medicaid and Medicaid-eligible populations receiving care at Memorial Hermann Hospital that meet the intervention criteria.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

While end-of-life care was once associated almost exclusively with terminal cancer, today we are providing end-of-life care for a number of other conditions, such as congestive heart failure and infants and their families in the NICU. Our experience has shown that that palliative and hospice care could be more widely embraced for many dying patients. The goal of palliative medicine is to improve or maintain quality of life in patients with life-limiting or life-threatening diseases. Palliative medicine is a recognized medical subspecialty of both the American Board of Medical Specialties and American Osteopathic Association. Palliative medicine involves the control of symptoms associated with chronic disease such as nausea, pain and shortness of breath for example, as well as management of the symptoms that are part of the dying process. Along with symptom control, palliative medicine teams provide comfort, social and spiritual interventions for patients & their families. Palliative care, unlike hospice, is provided simultaneously with all other appropriate disease-directed treatments (Morrison RS, Meier DE. Clinical practice: palliative care. N Engl J Med. 2004;350(25): 2582-2590). Palliative medicine programs markedly reduce lengths of stay in hospitals on both wards and ICU settings. Data from the 2009 American Hospital Association Annual Survey showed that between 2000 and 2008, the number of hospitals with palliative medicine programs grew by 125.8% from 658 to 1486 (Center for the Advancement of Palliative Care. http://www.capc.org/news-and-events/releases/04-05-10 accessed April 15, 2010). U.S. News and World Report has included palliative medicine as a criterion in its rankings of America's Best Hospitals since 2003 (Center for the Advancement of Palliative Care. http://www.capc.org/support-from-capc/capc_publications/JCAHO-crosswalk-new.pdf accessed January 21, 2008). In 2007, the National Quality Forum released a national framework and preferred practices for quality palliative and hospice care and in 2008 identified palliative care as one of seven priorities for rapid action (National Quality Forum. http://www.qualityforum.org/Projects/n-r/Palliative_and_Hospice_CareFramework/Palliative_Hospice_Care_Framework_and_Practices.aspx accessed April 15, 2010).

In addition to providing improved care and comfort for dying patients and their families, palliative care programs have been shown to provide considerable cost savings. According to a study of 5,354 subjects conducted by Morrison, et al. (Archives of Internal Medicine, 2008), palliative care teams saved $1,696 in direct costs per admission (P = .004) for patients discharged alive and $4,908 in direct costs per admission (P=.003) for patients who died. For a 400-bed hospital seeing 500 patients a year, this translates into a net savings of $1.3 million per year after adding physician revenues and subtracting personnel costs (Morrison RS, Penrod JD, Cassel JB, et al. Cost savings associated with United States hospital palliative care consultation programs. Arch Intern Med. 2008;168(16): 1783-1790). The palliative medicine service provided by UTHealth at Memorial Hermann Hospital-TMC has seen consistent growth in consult numbers since the program's inception in 2004. For the 532 patients receiving care in 2008, we saw a median per person per day savings of $5,292 after the palliative care consult (with a reduction in the average length of stay from 9.5 to 2.3 days) and for the 698 patients receiving palliative care consults in 2009, we realized a median per person per day savings of $4,727 (with a reduction in the average length of stay from 8.5 to 2.5 days). (Data from white paper: CBDyer, MD, GVaras, DO, N Walter. Palliative Medicine: A Critical Component of Modern Health Care. April, 2010.)

Project Components:

Through the Integrating Palliative Care into Critical Care Program, we propose to meet all required project components listed below.

a) UTP will develop a business case for palliative care
b) UTP will conduct the necessary planning activities prior to implementing the expanded palliative care program.
c) UTP will recruit additional physicians to provide palliative care at MHH.
d) UT Palliative Care Physicians will deliver palliative care to those patients with terminal illness at MHH and transition patients from acute hospital care into home care, hospice, or a skilled nursing facility wherever possible.
e) UTP will conduct patient/family experience surveys regarding the quality of care, pain and symptom management, and degree of patient/family centeredness in care with the aim to use this information to improve scores over time.
f) UTP's quality improvement office will conduct QI for each of the clinics providing specialty care using methods such as rapid cycle improvement.

Milestones and Metrics:

For the Integrating Palliative Care into Critical Care Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-1.]: Develop a hospital-specific business case for palliative care and conduct planning activities necessary as a precursor to implementing a palliative care program

Metric 1 [P-1.1.]: Business case

Milestone 2 [P-5.]: Implement a palliative care program

Metric 1 [P-5.1.]: Implement comprehensive palliative care program

Improvement Milestones and Metrics:

Milestone 3 [P-6.]: Increase the number of palliative care consults

Metric 1 [P-6.1.]: Palliative care consults meet targets established by the program
Milestone 4 [I-11.]: Establish the comfort of dying for patients with terminal illness within their end-of-life stage of care
Metric 1 [I-11.1.]: Pain screening (NQF-1634) Percentage of hospice or palliative care patients who were screened for pain during the hospice admission evaluation / palliative care initial encounter.
Milestone 5 [I-12.]: Implement a patient/family experience survey regarding the quality of care, pain and symptom management, and degree of patient/family centeredness in care and improve scores over time
Metric 1 [I-12.1.]: Survey developed and implemented; scores increased over time
Milestone 6 [I-9.]: Palliative care patients transitioned from acute hospital care into hospice, home care, or a skilled nursing facility (SNF) with and without hospice services.
Metric 1 [I-9.1.]: Transitions accomplished

Unique community need identification numbers the project addresses:
This project addresses community needs CN.7 (Insufficient access to care coordination practice management and integrated care treatment programs) and CN.23 (Lack of patient navigation, patient and family education and information programs).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project represents an expansion of a currently existing program. This project proposes to expand palliative care services to patients beyond cancer, congestive heart failure, and infants and their families in the NICU, to any patients and their families admitted to any adult ICU.

Related Category 3 Outcome Measure(s):
OD-13 Palliative Care
- IT-13.1 Pain assessment (NQF-1637) (Non-standalone measure)
  Increase the number of patients enrolled in hospice OR receiving palliative care who received a comprehensive clinical assessment to determine the severity, etiology and impact of their pain within 24 hours of screening positive for pain on the admission evaluation / initial encounter.
  Exclusion: patients with length of stay < 1 day in palliative care or <7 days in hospice, patients who were not screened for pain. Patients who screen negative for pain are excluded from the denominator.

OD-13 Palliative Care
- IT-13.2 Treatment Preferences (NQF 1641) (Non-standalone measure)
  Percentage of seriously ill patients enrolled in hospice OR receiving specialty palliative care in an acute hospital setting with chart documentation of preferences for life sustaining treatments.
  Exclusions: patients with length of stay < 1 day in palliative care or <7 days in hospice.

OD-13 Palliative Care
- IT-13.5 Percentage of patients receiving hospice or palliative care services with documentation in the clinical record of a discussion of spiritual/religions concerns or documentation that the patient/caregiver did not want to discuss. (NQF 1647 modified) (Non-standalone)

Increase the number of patients discharged from hospice or palliative care with clinical record documentation of spiritual/religious concerns or documentation that the patient/family did not want to discuss during the reporting period.

Relationship to other Projects:

1.9 (C4) - The disease management registry will serve as a useful resource to every provider, including palliative care providers, involved in caring for the enrolled patients.

2.11 (C10) - The medication management program will serve as a useful resource to palliative care providers, as they work to help the patient and their family achieve their care goals.

Relationship to Other Performing Providers' Projects in the RHP:

The regional need for palliative care is that of upmost priority and is addressed in this initiative. This initiative is unique to Pass 1 initiatives and focuses to outcome measures of pain assessments, treatment preferences, and patients receiving hospice and palliative care. The Region 3 Initiative Grid (addendum) can provide a cross reference to all other initiatives.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **2**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **1**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.2.4 X 2 = **1**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **5**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **1.55**

Project Option 2.11.1- 2.11 Conduct Medication Management: Patient-Centered Medication Therapy Management Program

Unique RHP Project ID: 111810101.2.5
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.
Intervention(s):
This project will implement a technologically driven patient-centered medication therapy management program. Allscripts analytics tool will enable staff to identify patients at high risk for developing complications and co-morbidities, and patients that have not refilled their medications. Patients will also have access to the patient portal, which will have detailed information on all their medications. Root cause analysis will be used to identify potential medication errors and quality improvement processes will be used to address the causes.
Need for the project:
Drug-related morbidity and mortality costs exceed $200 billion annually in the U.S. Patients with multiple chronic conditions are likely to be on multiple medications for long periods of time thereby increasing the risk of medication errors. Considering the high rates of chronic diseases in our region, this project willd lead to improved outcomes and cost savings for the health system.
Target Population:
This project primarily targets patients in our service areas with diabetes, hypertension, asthma, COPD, or CHF. Patients of lower socioeconmic status are known to have worse disease contol due to inability to maintain compliance in the long run, hence this project will be beneficial to the Medicaid population. UTP provided 321,716 patient visits in 2012 (20% were Medicaid clients) and expects to add another 80,000 patient visits (most are expected to be Medicaid clients) by the end of DY5, due to the UTP expansion of primary and specialty care services.
Category 1 or 2 expected patient benefits:
Our goal for DY4 is to increase the number of patients (meeting criteria for chronic condition) contacted or receiving medication management, and by DY5 to record improvement in selected clinical measures in target population.
Category 3 outcomes:
IT-1.2: Our goal is to improve by 3% in DY4 and 5% in DY5, the percentage of members 18 years of age and older who received at least 180 treatment days of ACE inhibitors or ARBs during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

Project Option 2.11.1 – Conduct Medication Management: C10 Patient-Centered Medication Therapy Management Program

Unique RHP Project Identification Number: 111810101.2.5
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 2.11 Conduct Medication Management (Option 2.11.1)

UT Physicians will implement a patient-centered medication therapy management program. Using the Allscripts analytics tool, staff will identify patients at high risk for developing complications and adverse effects from possible interactions, or non-compliance. Related patient information in the EMR will be used to review the complete medication regimen and history to assess compliance. Where there is an indication that a patient might not be compliant (Rx wasn't filled, etc.), or there are other reasons for concern, the appropriate member of the patient's healthcare team will follow up with the patient. Patients of UTP will receive counseling and education about the medications they are prescribed and an action plan will be developed that includes any further patient education needed, goal setting, and follow up appointments for potential adjustments in the medication regimen. Patient response will then be monitored and adjustments made accordingly. Patients will also have access 24/7 to the Jardogs patient portal, which will have a complete list of all current medications, including dosage information, information on how and why it is being used, and the prescribing physician. Patients will be educated on accessing the patient portal. The patient's healthcare team continue to work with the patient in resolving any barriers to compliance that could include any number of things. Root cause analysis will be done to identify reoccuring barriers to compliance and potential medication errors, and quality improvement processes will be used to address the causes.

Finally, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:

Project Goal:

To provide information to physicians, care teams, and patients that facilitates the appropriate use of medications in order to control illness and promote health

This project addresses the following regional goal:

Part of the goals of the region is to develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices; the medication management project ties closely with this aspiration by using technological support to reduce medication errors and improve drug compliance

Challenges:

Need: 1) High rates of chronic disease. 2) High risk of medication errors with polypharmacy.

Implementation: 1) Choosing the parameters that will be used to initiate action. 2) Implementing clinical processes to support proactive care. 3) Patient compliance with medication management efforts.

The medication management project will reduce the risk of medication errors in patients with multiple chronic conditions

5-Year Expected Outcome for Provider and Patients:

Acheivement of reduction in medication errors and drug interactions, resulting in improved adherence to chronic care medication therapy. By adopting a proactive medication therapy management program, potential dangerous interactions and ineffective treatment regimines can be avoided. Patients of UT Physicians, including the current Medicaid (23% as of 2011, or 65,302 patient visits) and low-income client base, will be safer and experience better health outcomes. In FY 2012, UTP provided 321,716 patient visits and expects to add another 80,000 (most, of which are expected to be Medicaid clients) by DY5 for over 400,000 patient visits. Using the Harris County rate (14.5%) of Medicaid clients, there are an estimated 1,423,176 Medicaid clients living within our service areas. We expect this program will help ensure these clients will also get the best health outcomes possible from their medication therapies.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

More than 3.5 billion prescriptions are written annually in the United States (Sommers JP. Prescription drug expenditures in the10 largest states for persons under age 65, 2005.2008. Agency for Healthcare Research and Quality. Available at: http://meps.ahrq.gov/mepsweb/data_files/publications/st196/stat196.pdf. Accessed 10/11/12). Medications are involved in 80 percent of all treatments and impact every aspect of a patient's life. According to the World Health Organization, adherence to therapy for chronic diseases in developed countries averages 50%, and the major consequences of poor adherence to therapies are poor health outcomes and increased health care costs (WHO. 2003. Adherence to long-term therapies: Evidence for action. Available at: http://whqlibdoc.who.int/publications/ 2003/9241545992.pdf. Accessed 10/11/12). Drug-related morbidity and mortality costs exceed $200 billion annually in the U.S., exceeding the amount spent on the medications themselves (Johnson J, Bootman JL. Drug-related morbidity and mortality. Arch Intern Med. 1995; 155(18):1949-1956; Johnson JA, Bootman JL. Drug-related morbidity and mortality. Am J Health Syst Pharm. 1997; 54(5):554-558; Ernst, FR, Grizzle AJ. Drug related morbidity and mortality: Updating the cost-of-illness model. J Am Pharm Assoc. 2001; 41(2):192-199)).

Patients with chronic diseases and multiple chronic conditions are likely to be on multiple medications for long periods of time thereby increasing the risk of medication errors. Considering the high rates of chronic diseases in our region, this projects would potentially lead to improved outcomes and cost savings for the health system.

Project Components:

Through the Patient-Centered Medication Therapy Management Program, we propose to meet all the required project components listed below.

a) UTP will develop criteria and identify targeted patient populations (e.g. chronic disease patient populations that are at high risk for developing complications, co-morbidities, and/or utilizing acute and emergency care services) using evidence-based criteria for medication management planning.
b) UTP will develop written medication management plans and tools to provide education and support to those patients at highest risk of non-compliance, an adverse drug event, or medication error.
c) UTP will implement an electronic tracking and alert system using Allscripts. UTP will recruit additional staff where necessary to conduct periodic medication reviews.
d) UTP will conduct root cause analysis of non-compliance, potential medication errors, or adverse drug events and develop/implement processes to address those causes.
e) UTP's quality improvement office will conduct QI for each of the clinics providing specialty care using methods such as rapid cycle improvement.

Milestones and Metrics:

For the Patient-Centered Medication Therapy Management Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-2.]: Develop criteria and identify targeted patient populations
Metric 1 [P-2.1.]: Establish evidence based criteria for medication management planning in target population based on assessment of population needs
Milestone 2 [P-2.]: Develop criteria and identify targeted patient populations
Metric 1 [P-2.2.]: Written medication management plan(s)

Improvement Milestones and Metrics:

Milestone 3 [I-9.]: Manage medications for targeted patients
Metric 1 [I-9.1.]: Increase the number of patients (meeting criteria for chronic condition) contacted or receiving medication management
Milestone 4 [I-16.]: Improvement in selected clinical measures in target population
Metric 1 [I-16.1.]: TBD by Performing Provider-Percent of patients who have shown improvement in selected clinical measures (e.g., blood pressure or LDLcholesterol) in targeted patient population

Unique community need identification numbers the project addresses:

This project addresses community needs CN.11 (High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project represents a new initiative. UT Physicians have not previously had access to these types of tools and processes for ensuring the safety of their patients receiving medication therapy and for achieving patients goals.

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Chronic Disease Management

- IT-1.2 Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012)219– angiotensin converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) (Non-standalone measure)
  Percentage of members 18 years of age and older who received at least 180 treatment days of ACE inhibitors or ARBs during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

OD-1 Primary Care and Chronic Disease Management

- IT-1.3 Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012)– digoxin (Non- standalone)
  Percentage of members 18 years of age and older who received at least 180 treatment days of digoxin during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

OD-1 Primary Care and Chronic Disease Management

- IT-1.4 Annual monitoring for patients on persistent medications (NCQA-HEDIS 2012)– diuretic (Non- standalone measure)
  Percentage of members 18 years of age and older who received at least 180 treatment days of a diuretic during the measurement year and had at least one serum potassium and either a serum creatinine or a blood urea nitrogen therapeutic monitoring test in the measurement year.

Relationship to other Projects:

1.1 (C3) - The medication management program will be an integral part of the coordinated care provided by the primary care physicians.

1.2 (A2, SPH1) - Structured educational training for health care providers on quality and cost control will entail instruction in medication therapy management for minimizing medication errors.

1.3 (C12) - The disease management registries and the medication management project will complement each other to ensure patients with chronic diseases, especially those with multiple chronic conditions, get optimal care with minimal errors and sustained active follow up.

1.6 (C11) - The medication management program with its technological support will provide the nurses with useful information on patients to inform more efficient triaging.

1.7 (A1) - The medication management project will ensure that patient medications are managed in a coordinated manner even with inputs and prescriptions from specialists at different sites.

1.9 (C4) - The medication management project will serve as a useful resource to every provider involved in managing the enrolled patients, to ensure optimum outcomes.

2.1 (C1-2) - The medication management program will be an integral component of the provision of care within the medical home model.

2.2 (C5-9,CL3) - The medication management program will be an important resource for the provision of chronic disease care using Wagner's model as proposed in these projects.

2.10 (MS3) - The medication management program will be a useful resource for those providing palliative care to reduce the risk of medication errors and in acheiving patient goals for care.

2.15 (C13) - The medication management program will be a useful resource for the primary care physicians and the behavioral health physicians providing integrated care.

Relationship to Other Performing Providers' Projects in the RHP:

Primary Care/Ambulatory Care clinics are a top priority to Region 3 due to the acuity of the regional patient mix, population concentration, and lack of primary care access points for our patient base. The regional approach of collaboration as well as existing patient referral pattern relationships allowed our team to properly identify the community needs based on the necessity of population, uninsured, and medically underserved patient bases. This program is consistent with our region and similar to numerous initiatives in our RHP plan sharing both concepts as well as outcome measures focused to percent improvement over baseline of patient satisfaction scores, reduction of inappropriate ED utilization, and third next available appointment status. The Region 3 Initiative Grid attached as a RHP Plan addendum reflects a grid of relationship for all initiatives.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **4**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **1**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.2.5 X 2 = **2**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **2**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been

the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **1.7**

Project Option 2.12.2- 2.12 Implement/Expand Care Transitions Programs: UT Physicians Transitions of Care

Unique RHP Project ID: 111810101.2.6
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
This project will implement a comprehensive transitions of care program whcih will ensure that patients have an appointment for follow-up with an appropriate physician(s) prior to leaving the hospital, understand their discharge medications and other instructions, and are followed up post discharge, particularly those at risk of needing acute care services within 30-60 days. This will be implemented with UT Physicians' network of hospitalists with 24/7 management of inpatients with specific medical and surgical conditions.

Need for the project:
This project addresses several community including insufficient access to care coordination practice management and high rates of preventable hospital readmissions. When a patient is discharged without optimal follow-up, it could lead to hospital readmission and possibly death. Without sufficient information and an understanding of their diagnoses, medication, and self-care needs, patients cannot fully participate in their care during and after hospital stays.

Target Population:
The care transitions project will be for special populations, namely: cancer surgery patients, indigent patiets with type 1 diabetes, and children/adolescents with type 1 diabetes who are graduating to adult diabetes management.

Category 1 or 2 expected patient benefits:
Our goal in DY4 is to improve adherence to processes, and by DY5 to improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transitions policies.
Category 3 outcomes:
IT-6.1 (1): Our goal is to increase by 3% in DY4 and 5% in DY5, the percent improvement over baseline of patient satisfaction scores on the adult CG-CAHPS survey module for are getting timely care, appointments, and information (for patients receiving the transitions of care intervention).

Project Option 2.12.2 – Implement/Expand Care Transitions Programs: A3,CL1,CL2,MS4 UT Physicians Transitions of Care

Unique RHP Project Identification Number: 111810101.2.6
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 2.12 Implement/Expand Care Transitions Programs (Option 2.12.2)

There is evidence that care coordination and transitional care can reduce unplanned hospital readmissions, which are an indicator of quality of care and a source of significant wasted hospital resources and expenditures. Care coordination is defined by the Agency for Healthcare Research and Quality (AHRQ) as the "deliberate organization of patient care activities between two or more participants (including the patients) involved in a patient's care to facilitate the appropriate delivery of health care services."(McDonald KM, Sundaram V, Bravata DM, et al. Care Coordination. Vol 7 of: Shojania KG, McDonald KM, Wachter RM, Owens DK, editors. Closing the Quality Gap: A Critical Analysis of Quality Improvement Strategies. Technical Review 9 (Prepared by the Stanford University-UCSF Evidence-based Practice Center under contract 290-02-0017). AHRQ Publication No. 04-(07)-0051-7. In. Rockville, MD: Agency for Healthcare Research and Quality; June 2007.) Transitional care, which is complementary to care coordination, is "a broad range of time-limited services designed to ensure health care continuity, avoid preventable poor outcomes among at-risk populations, and promote the safe and timely transfer of patients from one level of care to another or from one type of setting to another." (Naylor MD, Aiken LH, Kurtzman ET, Olds DM, Hirschman KB. The care span: The importance of transitional care in achieving health reform. Health Aff (Millwood) 2011;30:746-54.)

UT Health proposes to implement a comprehensive transitions of care program. UT Physicians will implement a discharge planning program and post discharge support program that ensures that patients have an appointment for follow-up with an appropriate physician(s) prior to leaving the hospital, understand their discharge medications and other instructions, and are followed up post discharge, particularly those at risk of needing acute care services within 30-60 days. This will be implemented with UT Physicians' network of hospitalists with 24/7 management of inpatients with medical and surgical conditions. Additionally, we have planned specific transitions of care interventions for several special populations.

Successful care coordination and transitional care programs have traditionally been implemented for medical rather than surgical patients and in settings where patients have ready access to primary care providers. Cancer care and outcomes are worst among racial/ethnic minorities and uninsured patients and at safety-net hospitals serving a disproportionate percentage of these patients. Cancer surgery at safety-net hospitals has been associated with delays, or failures, in receiving treatment (both surgical and adjuvant) and an increased risk of death. In addition, major postoperative complications and readmissions occur commonly among cancer surgery patients, both of which are associated with increased risk of death; readmission rates after complex surgery have been reported to be as high as 59% in one year. Transitions to home after cancer surgery can be difficult because of pain, decreased function and mobility, and surgery-related symptoms or complications. These transitions may be even more difficult among patients with limited social support, reduced health literacy, and unclear expectations regarding post-operative recovery. Comprehensive care programs for high-risk neonates and chronically ill

children have been successfully implemented in resource-poor, inner-city settings (Dallas and Houston, Texas) by Dr. Jon Tyson (UT Health). Both of these programs resulted in significantly reduced healthcare utilization (intensive care unit admissions, hospitalizations, emergency room visits) and costs. The comprehensive care program for chronically ill children in Houston was associated with a difference in combined inpatient and outpatient costs per year of almost $20K (preliminary analyses). (Broyles RS, Tyson JE, Heyne ET, et al. Comprehensive follow-up care and life-threatening illnesses among high-risk infants: A randomized controlled trial. Jama 2000;284:2070-6.) Thus, there is good rationale and evidence to suggest that a comprehensive transitional care program would reduce readmissions and emergency room visits without increasing costs in high-risk surgical patients. The program could have other potential benefits such as: decreased patient anxiety and increased patient satisfaction; improved quality of care (and care coordination); improved access to specialty care; and reduced disparities in surgical and cancer-specific outcomes. A comprehensive care coordination and transitions program will be developed and implemented for cancer surgery patients, which will provide deliberate organization of patient care activities between all care givers and participants (including the patients) involved in a patient's care that facilitates the right care at the right time and ensures continuity of care, avoids preventable poor outcomes, and promotes the safe and timely transfer of patients from one level of care to another, or from one type of setting to another.

In addition to targeting cancer surgery patients, we will also provide transitions of care targeting patients admitted with DKA. Often the indigent patients keep cycling back and forth in the hospital with multiple DKA admissions. Without sufficient information and an understanding of their diagnoses, medication, and self-care needs, patients cannot fully participate in their care during and after hospital stays. Hence, intensive monitoring as part of this project is needed to improve treatment compliance and reduce readmission rates in these patients. This enhanced transitions of care project could improve diabetes-related health outcomes in indigent patients with type 1 diabetes, who are prone to occurrence of diabetic ketoacidosis (DKA). With the addition of critical personnel to Endocrine Services, practice providers will: 1. Survey daily hospital admissions for diagnosis of DKA, 2. Visit patients, explain the program, and schedule patients for outpatient follow-up in the DKA clinic within 2 weeks of discharge, 3. Maintain contact with the patient at home to facilitate home insulin treatment and ensure outpatient clinic visit on appointed day, 4. Work with Dr. Orlander (UT) to ensure appropriate outpatient testing and care for the patient, and 5. Maintain the existing DKA database to monitor cost-effectiveness and clinical outcomes over time.

Also, children and adolescents with type 1 diabetes or other forms of early onset diabetes need a well-structured transitional care program to move from (usually highly organized) pediatric diabetes management to (usually less structured, more self-managed) adult diabetes management at the age of 18 years. The first encounter of “graduating” pediatric diabetic patients with the adult health care system is often in the hospital ED in diabetic ketoacidosis due to a lack of insulin or an untreated acute illness. DKA is a highly preventable cause of medical admission and could result in death. Children with type 1 diabetes constitute a special needs population as there is currently no program that pays special attention to their peculiar needs when "graduating" to adult care. Advanced practice providers will identify all adolescent diabetic patients who will “graduate” from pediatric to adult diabetes specialist care in the following 6 months, work with the patients and their parents to arrange the first adult diabetes clinic visit, ensure continuing supply of insulin and other necessary medications during the transition, and

arrange for diabetes education in self-management as an adult diabetic patient, and maintain a database for outcomes of this project.

Goal and Relationship to Regional Goals:

Project Goal:

To implement improvements in care transitions and coordination of care from inpatient to outpatient, post-acute care, and home care settings in order to prevent increased health care costs and hospital readmissions.

This project addresses the following regional goal:

Care transitions project will make it easier for patients to access care in a coordinated manner, thereby attaining the regional goal to "transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services..."

Challenges:

Need: 1) High rates of preventable hospital readmissions. 2) Insufficient access to care coordination practice management and integrated care treatment programs.

Implementation: 1) Ability to provide culturally appropriate discharge support. 2) Tackling barriers to compliance such as inability to afford care, transportation, and low literacy levels. 3) Identifying the main barriers and facilitators of implementing a comprehensive care program. 4) designing a feasible, effective, and self-sustainable program to address the problem of Unplanned readmissions. 5) Coordinating care across multiple services. 6) Determining which components of the multi-level program are most effective and efficient for which patients.

Dr. Jon Tyson's expertise in designing and implementing comprehensive care programs will assist us in addressing the implementation challenges.

5-Year Expected Outcome for Provider and Patients:

This transitional care project will provide "a broad range of time-limited services designed to ensure health care continuity, avoid preventable poor outcomes among at-risk populations, and promote the safe and timely transfer of patients from one level of care to another or from one type of setting to another." The at-risk populations will include the Medicaid and Medicaid-eligible patients of Memorial Hermann Hospital and UT Physicians. Patients receiving timely care, appointments and information, will have better outcomes and improved patient satisfaction.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

When a patient is discharged without optimal follow-up, it could have terrible consequences such as hospital readmission and possibly death. Without sufficient information and an understanding of their diagnoses, medication, and self-care needs, patients cannot fully participate in their care during and after hospital stays. Additionally, poorly designed discharge processes create unnecessary stress for medical staff causing failed communications, rework, and frustrations. A comprehensive and reliable discharge plan, along with proactive post-discharge support, can reduce readmission rates and improve health outcomes.

Project Components:

Through the UT Physicians Transitions of Care Program, we propose to meet all required project components listed below.

1) UTP will recruit additional staff to manage the transitions of care program.
2) UTP will work with MHH to develop processes using best practices and evidence-based protocols for effectively communicating with patients and families during discharge to improve adherence to discharge and follow-up care instructions. These processes will include:
   a. Use of discharge checklists,
   b. Development of post-discharge medication planning,
   c. Arranging post-op clinic visit before discharge,
   d. Development of "Hand off" communication plans between providers, and
   e. Provision of patient and family post-operative recovery education and wellness education.
3) UTP will conduct follow-up contacts with discharged patients using automated flags and reminders.

Milestones and Metrics:

For the UT Physicians Transitions of Care Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-1.]: Develop best practices or evidence-based protocols for effectively communicating with patients and families during and post-discharge to improve adherence to discharge and follow-up care instructions.

Metric 1 [P-1.1.]: Care transitions protocols

Milestone 2 [P-2.]: Implement standardized care transition processes

Metric 1 [P-2.1.]: Care transitions policies and procedures

Improvement Milestones and Metrics:

Milestone 3 [I-14]: Milestone: Implement standard care transition processes in specified patient populations.

Metric 1 [I-14.1]: Measure adherence to processes.

Milestone 4 [I-11.]: Improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transitions policies

Metric 1 [I-11.1]: Number over time of those patients in target population receiving standardized, evidence-based interventions per approved clinical protocols and guidelines

Unique community need identification numbers the project addresses:

This project addresses community needs CN.6 (Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly), CN.7 (Insufficient access to care coordination practice management and integrated care treatment programs), CN.9 (High rates of preventable hospital readmissions), and CN.10 (High rates of preventable hospital admissions).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

The project represents a new initiative. UT Physicians does not currently have any of the transitions of care initiatives described in this project.

Related Category 3 Outcome Measure(s):
OD-6 Patient Satisfaction

- IT-6.1 (1) Percent improvement over baseline of patient satisfaction scores: (1) are getting timely care, appointments, and information (Stand-alone measure)

Percent improvement over baseline of patient satisfaction scores (all questions within a survey need to be answered to be a stand-alone measure). Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients: (1) are getting timely care, appointments, and information (for patients receiving the transitions of care intervention)

Relationship to other Projects:

1.1 (C3) - The expanded capacity to deliver primary care will ensure that patients are able to be assigned to a care team in the UT medical homes.
1.2 (A2, SPH1) - The innovative residency program and the training of community health workers will ensure availability of human resources to facilitate the transition of patients between care givers in a medical home.
1.3 (C12) - The disease management registry will be a useful resource for the care team in ensuring that continuity of care is maintained.
1.7 (A1) - Telemedicine capabilities within the UT Medical Homes will provide increased capacity to deliver both primary and specialty care services to patients when and where needed.
1.9 (C4) - The expansion of specialty care in the primary care setting will provide a greater availability of needed services for cancer patients with complex needs.
2.1 (C1-2) - The UT Health Multispecialty Physician Group will provide an extensive network of specialty support centers for primary care providers in advanced medical homes, better equiped to care for patients transitioning from acute care who have complex needs.
2.2 (C5-9,CL3) - The chronic care management models being implemented within the UT Medical Homes will provide improved care for cancer patients who must also manage a chronic disease.

Relationship to Other Performing Providers' Projects in the RHP:

Primary Care/Ambulatory Care clinics are a top priority to Region 3 due to the acuity of the regional patient mix, population concentration, and lack of primary care access points for our patient base. The regional approach of collaboration as well as existing patient referral pattern relationships allowed our team to properly identify the community needs based on the necessity of population, uninsured, and medically underserved patient bases. This program is consistent with our region and similar to numerous initiatives in our RHP plan sharing both concepts as well as outcome measures focused to percent improvement over baseline of patient satisfaction scores, reduction of inappropriate ED utilization, and third next available appointment status. The Region 3 Initiative Grid attached as a RHP Plan addendum reflects a grid of relationship for all initiatives.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **6**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **2**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.2.6 X 2 = **3**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **4**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **2.8**

PProject Option 2.15.1- 2.15 Integrate Primary and Behavioral Health Care Services: Integrated Primary and Behavioral Health Care Services

Unique RHP Project ID: 111810101.2.7
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
UT Health will design, implement and evaluate a project that will integrate primary and behavioral healthcare services within UT Physicians' clinics to achieve a close collaboration in a partly integrated system of care (Level IV). A behavioral health provider will be placed in the primary care setting to provide patients with behavioral health services at their usual source of health care. This will facilitate care coordination between primary and behavioral healthcare.
Need for the project:
This project addresses several community needs including inadequate access to behavioral health care, and high rates of tobacco use and excessive alcohol use. The Health of Houston Survey, 2010, reported that 9% of residents did not see a behavioral health professional, even though they felt it was needed. Service integration will help to address the reasons care was not sought by the 31% that felt uncomfortable about it, the 22% that was concerned that someone would find out, the 17% that had trouble getting an appointment, and the 59% that had cost concerns.
Target Population:
The service areas of our 4 outlying clinics include health professional shortage areas, and medically underserved areas and populations. Using the Harris County rate (14.5%) of Medicaid clients, there are an estimated 1,423,176 Medicaid clients living within our service areas. In FY 2012, UTP provided 321,716 patient visits and expects to add another 80,000 (most, of which are expected to be Medicaid clients) primary and specialty patient visits (not counting behavioral health) by DY5 for over 400,000 patient visits.
Category 1 or 2 expected patient benefits:
Our goal in DY4 will be to increase the percentage of individuals receiving both physical and behavioral health care at the established locations, and by DY5 to increase the percent of individuals with a treatment plan developed and implemented with primary care and behavioral health expertise.
Category 3 outcomes:
IT-1.8: Our goal is to increase by 3% in DY4 and 5% in DY5, the percentage of UT Physicians patients who receive screening for clinical depression using a standardized tool, and for whom a follow-up plan is documented.

Project Option 2.15.1 – Integrate Primary and Behavioral Health Care Services: C13 Integrated Primary and Behavioral Health Care Services

Unique RHP Project Identification Number: 111810101.2.7
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 2.15 Integrate Primary and Behavioral Health Care Services (Option 2.15.1)

UT Health will design, implement and evaluate a project that will integrate primary and behavioral health care services within UT Physicians clinics to achieve a close collaboration in a partly integrated system of care (Level IV). The project will recruit and place a behavioral health provider in the primary care setting to provide patients with behavioral health services at their usual source of health care and will facilitate the coordination of care involving both primary and behavioral health. The project will focus on low behavioral health – low physical health complexity/risk (Quadrant I) and low behavioral health – high physical health complexity/risk (Quadrant III) of the Four Quadrant Model, which are most amendable to the primary care settings. This project will be structured to achieve level 4 (close collaboration in a partly integrated system, where providers share the same facility and share scheduling systems and medical records, and have regular face-to-face communication, functioning as a team), or preferably level 5, levels of interaction (close collaboration in a fully integrated system, where providers are part of the same team and system and the patient experiences mental health treatment as part of their regular primary care or vice versa). The need for any legal agreements that may be needed in a collaborative practice will be explored for this project, and in addition necessary arrangements will be made for facilities to achieve this service integration.

Along with the co-location of services, protocols, training, and team building will be implemented to improve communications and enhance coordination of care to deliver care that meets the needs of the whole person. Finally, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:
Project Goal:
Integrate primary care and behavioral health care services in order to improve care and access to needed services.
This project addresses the following regional goal:
Provision of both physical and behavioral health services in one location will make care more accessible to patients in a convenient location, and this relates to one of the goals of the region which is to "develop a regional approach to health care delivery that leverages and

improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction".

Challenges:

Need: 1) Insufficient access to integrated care programs for behavioral health and physical health conditions. 2) Inadequate access to behavioral health care. 3) High rates of tobacco use and excessive alcohol use.

Implementation: 1) Motivation and ability of primary care and behavioral health teams to work together. 2) Patient awareness about service availability.

Despite high indicators of need, patients experience barriers in accessing behavioral health servcices, such as the stigma attached to mental health facilities and the inconvenience of adding another visit to their health care regimen. The integration of behavioral and primary care in this project enables patients to access coordinated efficient care in a convenient and less-stigmatized setting. Primary care providers will be trained to consult with and direct patients that may need behavioral health care services to the behavioral health provider. The behavioral health provider will have access to the patients records and be trained to consult with and direct patients to the primary care provider that may warrant further primary care services, or screenings. Patients will be able to address both behavioral health needs and primary care needs in a single visit.

5-Year Expected Outcome for Provider and Patients:

Attainment of a level 4 or 5 integration level in primary care and behavioral health will help to achieve optimal patient outcomes. This will lead to increased screening and better management of depression in the population served by UT Physicians and better health overall. In addition to benefiting the current Medicaid (23% as of 2011, or 65,302 patient visits) and low-income client base of UTP clinics, the program will be available to an additional 1,423,176 Medicaid and Medicaid-eligible residents living within the service areas of the UT Physician Clinics. In FY 2012, UTP provided 321,716 patient visits and expects to add another 80,000 (most, of which are expected to be Medicaid clients) primary and specialty patient visits (not counting behavioral health) by DY5 for over 400,000 patient visits.

Starting Point/Baseline:

To be determined during DY3.

Rationale:

Patients will be able to receive care that is more convenient (located within their community and in a clinic offering extended hours), coordinated (ability to address both conditions in a single visit), and in a setting that reduces the stigma of receiving behavioral health services, since it is located within the primary care setting. The Health of Houston Survey, 2010, reported that 9% of residents did not see a behavioral health professional, even though they felt it was needed. The integration of behavioral health into the primary care setting will help to address the reasons care was not sought by the 31% that felt uncomfortable about it, the 22% that was concerned that someone would find out, the 17% that had trouble getting an appointment, and the 59% that were concerned about the cost. The primary care setting can provide increased continuity of care for behavioral health care problems, often occuring over extended periods of time, with symptoms that range from well-controlled to severe.

Project Components:

Through the Integrated Primary and Behavioral Health Care Services Program, we propose to meet all required project components listed below.

1. UTP will identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community.
2. UTP will develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated. UTP will also develop any necessary legal agreements that may be needed in a collaborative practice.
3. Also, protocols and processes for communication, data sharing, and referral between behavioral and physical health providers will be established that will include:
    a. Regular consultative meetings between physical health and behavioral health practitioners,
    b. Case conferences on an individualized as-needed basis to discuss individuals served by both types of practitioners, and/or
    c. Shared treatment plans co-developed by both physical health and behavioral health practitioners.
4. UTP will recruit specialty providers (mental health and substance abuse) and support staff to provide mental health services in the primary care clinics.
5. UTP will train physical and behavioral health providers in protocols, effective communication and team approach.
6. UTP will acquire the necessary data reporting, communication and collection tools (equipment) to be used in the integrated setting.
7. UTP will develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual treated in these integrated service settings.
8. UTP's quality improvement office will conduct QI for each of the clinics providing specialty care using methods such as rapid cycle improvement.

Milestones and Metrics:

For the Integrated Primary and Behavioral Health Care Services Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

Process Milestones and Metrics:

Milestone 1 [P-2.]: Identify existing clinics or other community-based settings where integration could be supported. It is expected that physical health practitioners will share space in existing behavioral health settings, but it may also be possible to include both in new settings or for physicians to share their office space with behavioral health practitioners.

Metric 1 [P-2.1.]: Discussions/Interviews with community healthcare providers (physical and behavioral), city and county governments, charities, faith-based organizations and other community based helping organizations.

Milestone 3 [P-5.]: Develop integrated sites reflected in the number of locations and providers participating in the integration project:

Metric 1 [P-5.1.]: Number of agreements signed for the provision of integrated services

Metric 2 [P-5.2.]: Number of primary care providers newly located in behavioral health settings.

Metric 3 [P-5.3.]: Number of behavioral health providers newly located in primary care clinics.

Improvement Milestones and Metrics:

Milestone 4 [I-8.]: Integrated Services

Metric 1 [I-8.1.]: X% of Individuals receiving both physical and behavioral health care at the established locations.

Milestone 5 [I-9.]: Coordination of Care

Metric 1 [I-9.1.]: X% of Individuals with a treatment plan developed and implemented with primary care and behavioral health expertise

Unique community need identification numbers the project addresses:

This project addresses community needs CN.3 (Inadequate access to behavioral health care), CN.12 (High rates of tobacco use and excessive alcohol use), and CN.18 (Insufficient access to integrated care programs for behavioral health and physical health conditions).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project represents a new initiative. UT Physicians does not currently provide behavioral health care at its 4 outlying (outside the TMC) clinics. UT Physicians will hire behavioral health providers to work with primary care providers to provide comprehensive and integrated care for patients in these 4 clinics, which serve areas that include large populations with economic, cultural, language, and transportation barriers to receiving care.

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Chronic Disease Management

- IT-1.8 Depression management: Screening and Treatment Plan for Clinical Depression (PQR 2011, #134) (Non- standalone measure)
  Numerator: Patient's screening for clinical depression using a standardized tool AND follow-up plan is documented.

OD-1 Primary Care and Chronic Disease Management

- IT-1.9 Depression management: Depression Remission at Twelve Months (NQF# 0710) (Standalone measure)
  Numerator: Adults age 18 and older with a diagnosis of major depression or dysthymia and an initial PHQ-9 score greater than nine who achieve remission at twelve months as demonstrated by a twelve month (+/- 30 days) PHQ-9 score of less than five.
  Denominator: Adults age 18 and older with a diagnosis of major depression or dysthymia and an initial PHQ-9 score greater than nine.
  Exclusions: Patients who die, are a permanent resident of a nursing home or are enrolled in hospice are excluded from this measure. Additionally, patients who have a diagnosis (in any position) of bipolar or personality disorder are excluded.

Relationship to other Projects:

1.1 (C3) - Expanded primary care services will ensure there is reserve capacity to handle the increased collaboration necessary for integration physical health care with behavioral health care in the primary care setting.

1.2 (A2, SPH1) - Structured educational training for health care providers on team-based models of care will equip physicians and CHWs with the knowledge and skills to deliver this integrated model of care.
1.3 (C12) - The disease management registries will be a useful tool for the integrated care team in providing appropriate care for patients managing chronic diseases.
1.6 (C11) - The nurse triage line will provide 24/7 access to care for patients receiving both behavioral and physical health care.
1.7 (A1) - The telemedicine program will provide greater access for patients to their care providers (behavioral, primary and specialty care) when needed, particularly when distance is a barrier.
1.9 (C4) - The expansion of specialty services in the primary care setting will help to ensure that patients receiving integrated care will also have access to other specialty care when necessary in the same care setting.
2.1 (C1-2) - Patients receiving the integrated model of behavioral and physical health care will be enrolled in the UT Health Medical Homes.
2.2 (C5-9,CL3) - Patients with chronic diseases receiving the integrated model of behavioral and physical health care, will also received evidence-based care for their chronic disease. UTHealth will be using Wagner's chronic disease management model to manage chronic disease.
2.11 (C10) - The medication management program will be an integral component in the provision of integrated behavioral and physical health care.

Relationship to Other Performing Providers' Projects in the RHP:

The cohabitation of primary care and behavioral health is an important focus of our region in order to treat the patient base with comprehensive physical and behavioral healthcare issues. There are multiple initiatives in our RHP plan that address this need and all can be found on the Region 3 Initiative Grid in the addendums. The outcome measures focused to screening measures and access of the patient base.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **5**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **2**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.2.7 X 2 = **7**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **2**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **3.1**

The University of Texas Health Science Center - Houston

Pass 3

Project Option 2.15.1- 2.15 Integrate Primary and Behavioral Health Care Services: Integrated Primary and Behavioral Health Care Services for Children and Adolescents

Unique RHP Project ID: 111810101.2.8
Performing Provider Name/TPI: UTHealth, UTPhysicians / 111810101

Project Summary:

Provider:
UT Physicians is the clinical practice of The University of Texas Medical School at Houston. With more than 900 physicians certified in 80 medical specialties and subspecialties, 906 residents and fellows, and 283,920 patient visits in 2011, it is the fastest growing academic practice in the nation for the last five years. In addition to our flagship location in the Texas Medical Center, UT Physicians has 4 neighborhood locations throughout the Greater Houston area, and also offers specialty clinics at several Memorial Hermann Hospital locations.

Intervention(s):
UT Health will design, implement and evaluate a project that will integrate primary and behavioral healthcare services for children and adolescents within UT Physicians' clinics to achieve a close collaboration in a partly integrated system of care (Level IV). A pediatric behavioral health provider will be placed in the primary care setting to children and adolescents with behavioral health services at their usual source of health care. This will facilitate care coordination between primary and behavioral healthcare.

Need for the project:
20% of children either have, or will have a debilitating mental disorder and about 13% of children ages 8 to 15 had a diagnosable mental disorder within the previous year, though only half received any treatment. This project addresses several community needs including inadequate access to behavioral health care.

Target Population:
The service areas of our 4 outlying clinics include health professional shortage areas, and medically underserved areas and populations. Using the Harris County rate (14.5%) of Medicaid clients, there are an estimated 1,423,176 Medicaid clients living within our service areas.

Category 1 or 2 expected patient benefits:
Our goal in DY4 will be to increase the percentage of children/adolescents receiving both physical and behavioral health care at the established locations, and by DY5 to increase the percent of children/adolescents with a treatment plan developed and implemented with primary care and behavioral health expertise.

Category 3 outcomes:
Our goal is the reduce the number of days to third next available appointment to two days for a pediatric behavioral health appointment (IT-1.1) and to increase by 5% in DY5 the number of patients ages 6-18 who complete at least 84 days of continuous treatment with an antidpressant medication during the 114-day acute phase treatment period folloing the IPSD and who complete at least 180 days of continuoust treatment with antidepressant medication during the 231-day continuation phase following the IPSD (IT-1.19).

Project Option 2.15.1 – Integrate Primary and Behavioral Health Care Services: Integrated Primary and Behavioral Health Care Services for Children and Adolescents

Unique RHP Project Identification Number: 111810101.2.8
Performing Provider Name/TPI: UTHealth, UTPhysicians/111810101

Project Description: 2.15 Integrate Primary and Behavioral Health Care Services (Option 2.15.1)

UT Health will design, implement and evaluate a project that will integrate primary and behavioral health care services for children and adolescents within UT Physicians 4 outlying clinics and the pediatric specialty clinic in the Texas Medical Center in order to achieve a close collaboration in a partly integrated system of care (Level IV). The project will recruit and place a pediatric behavioral health provider in the 4 primary care settings and the 1 pediatric specialty care clinic to provide children and adolescents with behavioral health services at their usual source of health care and will facilitate the coordination of care involving both primary and behavioral health. For the 4 outlying clinics, the project will focus on low behavioral health – low physical health complexity/risk (Quadrant I) and low behavioral health – high physical health complexity/risk (Quadrant III) of the Four Quadrant Model, which are most amendable to the primary care settings. Quadrants II and IV will be included with Quadrants I and III for the pediatric specialty care clinic in the Texas Medical Center. This project will be structured to achieve level 4 interaction (close collaboration in a partly integrated system, where providers share the same facility and share scheduling systems and medical records, and have regular face-to-face communication, functioning as a team), or preferably level 5 interaction (close collaboration in a fully integrated system, where providers are part of the same team and system and the patient experiences mental health treatment as part of their regular primary care or vice versa). The need for any legal agreements that may be needed in a collaborative practice will be explored for this project, and in addition necessary arrangements will be made for facilities to achieve this service integration.

Along with the co-location of services, protocols, training, and team building will be implemented to improve communications and enhance coordination of care to deliver care that meets the needs of the whole person. Finally, through project MS1 (UT Health Regional Systems Engineering Center and UT Health Quality Improvement Dashboard Development Center), the systems engineering and QI teams at UT Health will identify QI targets and methods needed to achieve continuous quality improvement for this project, especially as it relates to identifying challenges for expansion, and building on lessons learned.

Goal and Relationship to Regional Goals:
Project Goal:
Integrate primary care and behavioral health care services in order to improve care and access to needed services.

<u>This project addresses the following regional goal:</u>

Provision of both physical and behavioral health services in one location will make care more accessible to patients in a convenient location, and this relates to one of the goals of the region which is to "develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction".

Challenges:

Need: 1) Insufficient access to integrated care programs for behavioral health and physical health conditions. 2) Inadequate access to behavioral health care. 3) High rates of tobacco use and excessive alcohol use.

Implementation: 1) Motivation and ability of primary care and behavioral health teams to work together. 2) Patient awareness about service availability.

Despite high indicators of need, parents of pediatric patients experience barriers in accessing behavioral health services, such as the stigma attached to mental health facilities and the inconvenience of adding another visit to their child's health care regimen. The integration of pediatric behavioral and primary care in this project enables parents of pediatric patients to access coordinated efficient care in a convenient and less-stigmatized setting. Primary care providers will be trained to consult with and direct patients that may need behavioral health care services to the pediatric behavioral health provider. The pediatric behavioral health provider will have access to the patients records and be trained to consult with and direct patients to the primary care provider that may warrant further primary care services, or screenings. Parents of pediatric patients will be able to address both behavioral health needs and primary care needs in a single visit.

5-Year Expected Outcome for Provider and Patients:

Attainment of a level 4 or 5 integration level in primary care and behavioral health will help to achieve optimal patient outcomes. This will lead to increased screening and better management of depression in the population served by UT Physicians and better health overall. In addition to benefiting the current Medicaid (23% as of 2011, or 65,302 patient visits) and low-income client base of UTP clinics, the program will be available to the pediatric population proportion of an additional estimated 80,000 patient visits expected as a result of UTP's primary and specialty care expansion.

<u>Starting Point/Baseline:</u>

To be determined during DY3.

<u>Rationale:</u>

According to the National Institute of Mental Health, 1 in 5 children (20%), either have, or will have a seriously debilitating mental disorder and data from the CDC's National Health and Nutrition Examination Survey showed that about 13% of children ages 8 to 15 had a "diagnosable mental disorder within the previous year," yet in the preceeding year, only half had received treatment for their disorder. (Merikangas KR, He JP, Merikangas KR, He J, Burstein M, Swanson SA, Avenevoli S, Cui L, Benjet C, Georgiades K, Swendsen J. Lifetime prevalence of mental disorders in U.S. adolescents: Results from the National Comorbidity Study-Adolescent Supplement (NCS-A). J Am Acad Child Adolesc Psychiatry. 2010 Oct;49(10):980-

989. http://www.nimh.nih.gov/statistics/1ANYDIS_CHILD.shtml) (Merikangas KR, He JP, Brody D, Fisher PW, Bourdon K, Koretz DS. Prevalence and treatment of mental disorders among US children in the 2001-2004 NHANES. Pediatrics. 2010, 125(1):75-81. http://www.nimh.nih.gov/statistics/1NHANES.shtml) By providing pediatric behavioral health services in the primary care setting, children and adolescents will be able to receive care that is more convenient for their parents (located within their community and in a clinic offering extended hours), coordinated (ability to address both conditions in a single visit), and in a setting that reduces the stigma surrounding behavioral health services, since it is located within the primary care setting.

Project Components:

Through the Integrated Primary and Behavioral Health Care Services Program, we propose to meet all required project components listed below.

9. UTP will identify sites for integrated care projects, which would have the potential to benefit a significant number of children/adolescents in the community.
10. UTP will develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated. UTP will also develop any necessary legal agreements that may be needed in a collaborative practice.
11. Also, protocols and processes for communication, data sharing, and referral between behavioral and physical health providers will be established that will include:
    a. Regular consultative meetings between physical health and behavioral health practitioners,
    b. Case conferences on an individualized as-needed basis to discuss individuals served by both types of practitioners, and/or
    c. Shared treatment plans co-developed by both physical health and behavioral health practitioners.
12. UTP will recruit specialty providers (pediatric mental health providers) and support staff to provide mental health services in the primary care clinics and in the pediatric specialty clinic.
13. UTP will train physical and behavioral health providers in protocols, effective communication and team approach.
14. UTP will acquire the necessary data reporting, communication and collection tools (equipment) to be used in the integrated setting.
15. UTP will develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individuals treated in these integrated service settings.
16. UTP's quality improvement office will conduct QI for each of the clinics providing specialty care using methods such as rapid cycle improvement.

Milestones and Metrics:

For the Integrated Primary and Behavioral Health Care Services Program, we have chosen the below milestones and metrics based upon the above project components and relationship to project goals and population needs. All baselines and goals will be determined during DY2.

<u>Process Milestones and Metrics</u>:

Milestone 1 [P-2.]: Identify existing clinics or other community-based settings where integration could be supported. It is expected that physical health practitioners will share space in existing behavioral health settings, but it may also be possible to include both in new settings or for physicians to share their office space with behavioral health practitioners.
Metric 1 [P-2.1.]: Discussions/Interviews with community healthcare providers (physical and behavioral), city and county governments, charities, faith-based organizations and other community based helping organizations.
Milestone 3 [P-5.]: Develop integrated sites reflected in the number of locations and providers participating in the integration project:
Metric 1 [P-5.1.]: Number of agreements signed for the provision of integrated services
Metric 3 [P-5.3.]: Number of pediatric behavioral health providers newly located in primary care clinics.

Improvement Milestones and Metrics:

Milestone 4 [I-8.]: Integrated Services
Metric 1 [I-8.1.]: X% of Individuals (children/adolescents) receiving both physical and behavioral health care at the established locations.
Milestone 5 [I-9.]: Coordination of Care
Metric 1 [I-9.1.]: X% of Individuals (children/adolescents) with a treatment plan developed and implemented with primary care and behavioral health expertise

Unique community need identification numbers the project addresses:

This project addresses community needs CN.3 (Inadequate access to behavioral health care) and CN.18 (Insufficient access to integrated care programs for behavioral health and physical health conditions).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project represents a new initiative. UT Physicians does not currently provide pediatric behavioral health care at its 4 outlying (outside the TMC) clinics. UT Physicians will hire behavioral health providers to work with primary care providers to provide comprehensive and integrated care for pediatric patients in these 4 clinics and in the pediatric specialty clinic, which serve areas that include large populations with economic, cultural, language, and transportation barriers to receiving care.

Related Category 3 Outcome Measure(s):

OD-1 Primary Care and Chronic Disease Management
IT-1.1 Third next available appointment (Non- standalone measure)
Reduce the average length of time in days between the day a patient makes a request for an appointment with a physician and the third available appointment for a new patient physical, routine exam, or return visit exam.

OD-1 Primary Care and Chronic Disease Management
IT-1.19 Antidepressant Medication Management - NQF 0105 (Standalone measure)
The management of antidepressant medication in children ages 6-18 who were discharged alive) from an acute inpatient setting (including acute care psychiatric facilities) with a

principal mental health diagnosis: A) the acute phase treatment period consisting at least 84 days (12 weeks) of continuous treatment with antidepressant medication during the 114-day period following the IPSD (inclusive), and B) the continuation phase treatment period consisting of at least 180 days (6 months) of continuous treatment with antidepressant medication (Table AMM-D) during the 231-day period following the IPSD (inclusive).

Relationship to other Projects:

1.1 (C3) - Expanded primary care services will ensure there is reserve capacity to handle the increased collaboration necessary for integration physical health care with behavioral health care in the primary care setting.

1.2 (A2, SPH1) - Structured educational training for health care providers on team-based models of care will equip physicians and CHWs with the knowledge and skills to deliver this integrated model of care.

1.3 (C12) - The disease management registries will be a useful tool for the integrated care team in providing appropriate care for patients managing chronic diseases.

1.6 (C11) - The nurse triage line will provide 24/7 access to care for patients receiving both behavioral and physical health care.

1.7 (A1) - The telemedicine program will provide greater access for patients to their care providers (behavioral, primary and specialty care) when needed, particularly when distance is a barrier.

1.9 (C4) - The expansion of specialty services in the primary care setting will help to ensure that patients receiving integrated care will also have access to other specialty care when necessary in the same care setting.

2.1 (C1-2) - Patients receiving the integrated model of behavioral and physical health care will be enrolled in the UT Health Medical Homes.

2.2 (C5-9,CL3) - Patients with chronic diseases receiving the integrated model of behavioral and physical health care, will also received evidence-based care for their chronic disease. UTHealth will be using Wagner's chronic disease management model to manage chronic disease.

2.11 (C10) - The medication management program will be an integral component in the provision of integrated behavioral and physical health care.

Relationship to Other Performing Providers' Projects in the RHP:

The cohabitation of primary care and behavioral health is an important focus of our region in order to treat the patient base with comprehensive physical and behavioral healthcare issues. There are multiple initiatives in our RHP plan that address this need and all can be found on the Region 3 Initiative Grid in the addendums. The outcome measures focused to screening measures and access of the patient base.

Plan for Learning Collaborative:

UTHealth will participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

The anchor, Harris Health, provided a spreadsheet which contained 6 criteria, which could be used to rate each project on a 10-point scale. The ratings for each criterion were weighted, summed for each project to arrive at a total score (value weight) for each project. The sum of all the project's total scores were then divided by the percent of total DSRIP funds to be secured for that year to arrive at a dollar value multiplier to be applied towards each project's total score (value weight), thereby allocating a greater proportion of the funds towards those projects valued highest based upon the 6 criteria. UTHealth used this approach, with one exception—we did not use two of the criteria. Following are the criteria, the considerations for awarding points for projects using that criteria, and the reasons two of the criteria were not used:

1. Transformational Impact (Weight = 20%): Points were awarded for projects that meet the community benefit criteria, such as: improving access; improving quality; improving costs (long-term cost-savings); transformative (Innovative), collaborative (partners with other organization(s)). This project's score for this criterion: **5**

2. Population Served/Project Size (Weight = 20%): Points were awarded based on the size of the population affected and whether the target population is uninsured or on Medicaid. This project's score for this criterion: **2**

3. Aligned with Community Needs (Weight = 20%): Points were awarded based on judgments in two categories: whether or not the CNA indicates a need in the area of the project and the severity of the health/healthcare need(s) the project addresses. This project's score for this criterion: 111810101.2.7 X 2 = **7**

4. Cost Avoidance (Weight = 15%): Points were awarded based on judgment of project's cost effectiveness relative to similar projects. This project's score for this criterion: **2**

5. Partnership/Collaboration (Weight = 10%): ***This was not rated***, because UTHealth planned to partner with Harris Health to perform many similar projects, so the rating would have been the same for all projects. This would have diluted the scores, hiding the more significant variations in other value criteria.

6. Sustainability (Weight = 15%): ***This was also not rated***, because UTHealth does not consider any of the projects to be unsustainable, or at the very least do not consider one project less sustainable than another. Giving the projects the same, or very similar ratings on this criteria again would have had a diluting effect, hiding the more significant variations in other value criteria.

Total Valuation Score for this project: **3.1**

University of Texas M.D. Anderson Cancer Center

Pass 1

Project Option 2.7.1 – Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations (e.g., mammography screens, colonoscopies, prenatal alcohol use, etc.): Colorectal cancer (CRC) screening program for low-income residents of RHP3.

Unique RHP Project ID: 112672402.2.1

Performing Provider Name/TPI: The University of Texas MD Anderson Cancer Center / 112672402

Project Summary:

Provider: The University of Texas MD Anderson Cancer Center is a comprehensive cancer center ranked first in cancer care by *U.S. News & World Report* and dedicated to patient care, education, research and prevention. MD Anderson is comprised of several Texas Medical Center campus locations, two research campuses in Bastrop County, Texas, four regional care centers and a number of national and international divisions and affiliates. More than 108,000 people—almost one-third of them new patients—were seen in FY2011. MD Anderson provided $215 million in uncompensated charity care to Texans in FY2011.

Intervention(s): This project will expand a two-year Colorectal Cancer (CRC) screening program in Federally Qualified Health Centers (FQHCs) in Harris County into other RHP3 counties. This project targets low-income and underinsured populations with the intent of increasing adherence by distributing Fecal Immunochemical Test (FIT) take-home tests at the time of annual flu innoculation. Patients will receive a FIT test with verbal and written instructions on how to complete the test, brief verbal messages reinforcing the importance of screening (e.g., "an annual FOBT (FIT) test is as important as an annual flu shot"), educational materials, and clinic phone numbers should questions arise.

Need for the project: **A)** This program relates to the identified Community Needs in RHP3: CN.2-Inadequate access to specialty care; CN.11-High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with cancer; CN.20-Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs; CN.22-Insufficient access to services that are specifically designed to address racial, ethnic and cultural health care disparities; CN.23-Lack of patient navigation, patient and family education and information programs. **B)** There is a multi-county need as data from the 2010 Behavioral Risk Factor Surveillance indicates that in Public Health Administrative Region 6/5S, only 38.6% of adults 50 years and older reported having ever had a sigmoidoscopy or colonoscopy in the past 5 years, and 13.9% reported annual fecal occult blood testing. This is well below the ACS' 2015 goal of 75% of all adults over 50 having a recent CRC screening test.

Target Population: Indigent and Medicaid patients, aged 50 years and older, who, in accordance with the U.S. Preventive Services Task Force recommendations, qualify for CRC screening.

Category 1 or 2 expected patient benefits: The DY4 goal is to increase the number in the target population receiving FIT by 5% over DY3. The DY5 goal is to increase number of target population receiving FIT by 5% over DY4.

Category 3 outcomes: **IT-11.3**: Improve utilization rates of clinical preventive services (CRC screening) in target population with identified disparity – Number of individuals of target population reached by the FIT/Flu project. **IT-12.3**: Colorectal Cancer Screening (HEDIS 2012): Number of adults aged 50 -75 who have received one of the following screenings: Fecal occult blood test yearly, flexible sigmoidoscopy every five years, and colonoscopy every 10 years.

Project Option 2.7.1 – Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations (e.g., mammography screens, colonoscopies, prenatal alcohol use, etc.): Colorectal cancer (CRC) screening program for low-income residents of RHP3

Unique RHP Project Identification Number: 112672402.2.1
Performing Provider Name/TPI: The University of Texas MD Anderson Cancer Center / 112672402

Project Description:
We propose to implement a FIT-Flu program in RHP3 targeting low-income and underinsured populations with the intent of increasing adherence with this screening method.

We selected the FIT test because it requires less patient preparation compared with FOBT. An evidence-based intervention developed by Dr. Michael Potter at the University of California at San Francisco (UCSF), the FIT/Flu combines the distribution of either FOBT or FIT tests with annual flu inoculations. The FIT test analyzes specific antibodies to human blood components, and thus does not require patients to follow any dietary or medication restrictions. The FIT-Flu intervention involves offering patients who undergo annual flu inoculations a stool test to take home and return via mail in a postage-paid envelope.

This intervention has demonstrated significant increases in screening adherence across diverse patient populations and settings. Study settings included community clinics that served multiethnic and low income populations with low baseline CRC screening rates, as well as retail chain pharmacies where flu shots are typically offered. In a study involving annual flu shot clinics, there was a significant increase in FIT adherence over baseline in the FIT-Flu intervention group (from 54.4% to 84.3%) versus a control group that received only CRC screening education (from 52.9% to 57.3%).[1] More modest increases in adherence were achieved in a study involving primary care clinics, with the intervention group increasing from 32.5% to 45.5% versus the control group which rose from 31.3% to 35.6%.[2]

The success of this intervention may be attributed to even this brief interaction between clinician and patient at the time of flu inoculation, as it offers a "teachable moment" to reinforce the need for regular screening. Studies provide consistent evidence that a FIT-Flu intervention is a practical strategy with high potential to increase CRC screening adherence in community clinic settings. Furthermore, evidence generated by these studies indicates a strong likelihood of successful replication in real world, non-controlled settings.

This project expands a currently ongoing two year FIT/Flu initiative in Federally Qualified Health Centers (FQHCs) in Harris County in other RHP3 counties. We will reach indigent and Medicaid patients, age 50 years and older, who, in accordance with the U.S. Preventive Services Task Force (USPSTF) recommendations, qualify for CRC screening.[3] Our exclusion criteria include the following:

- Allergic to flu vaccine or refusal to receive a flu inoculation
- Active inflammatory bowel disease (Crohn's, ulcerative colitis)
- Visible rectal bleeding
- Hematuria

- Menstruation at the time of obtaining a stool specimen
- A positive FOBT or FIT test in the past 12 months
- A colonoscopy or sigmoidoscopy within the past 5 years
- A medical condition that would preclude any benefit from OC (cancer or any terminal illness)
- Inability to prepare a stool specimen
- Patient with an ileostomy or colostomy
- Symptomatic acute colitis or acute diarrhea
- Recent acute diverticulitis
- Recent colorectal surgery

Patients in our project will receive a FIT with verbal and written instructions on how to complete the test, brief verbal messages reinforcing the importance of screening (e.g., "an annual FOBT (FIT) test is as important as an annual flu shot"), educational materials, and clinic phone numbers should questions arise. We anticipate receiving 50% return of stool specimens for processing, of which approximately 15% (published ranges of 8-14%) may be positive.[4-5] Patients with positive FIT tests will be referred for optical colonoscopy. Endoscopy providers will be contracted to provide these services. Uninsured individuals diagnosed with cancer will be navigated to Harris Health Systems or other providers.

Goal(s) and Relationship to Regional Goal(s):

The goal of this project is utilize an evidence based approach in RHP3 FQHC clinics and other primary care offices to increase CRC screening by distributing the take-home FIT test at the time of flu inoculation. Patient Navigators will follow-up those patients who do not return the FIT to encourage them to do so and will navigate those patients with positive FIT results to screening colonoscopy. Culturally sensitive educational and instructional materials will be distributed to increase patient knowledge about CRC and the importance of early screening. We will partner with the American Cancer Society (ACS) to offer professional education and support material to assist primary care physicians in providing appropriate CRC screening recommendations to their patient population.

Project Goals:

- Reduce the incidence and mortality of colorectal cancer in the indigent and Medicaid population through the increased use of a low-cost stool test for the early detection of adenomas and cancers.
- Increase target population's knowledge about the risk factors and screening guidelines for CRC.
- Increase the use of appropriate CRC screening in the primary care setting.
- This project meets the following Region 3 goals:
- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.

The FIT-Flu program aims to reduce the incidence and mortality of colorectal cancer by offering a process to dispense CRC screening in the primary care setting. This project will be implemented in FQHCs in RHP3 and is an extension of an existing program in Harris County FQHCs.

Challenges:

According to the Agency for Healthcare Research and Quality (AHRQ), only about half of all adults aged 50-75 have ever received age-appropriate colorectal cancer (CRC) screening, and the proportion of minority populations who have ever been screened is reported to be approximately 30%.[6] The Texas Cancer Registry indicates that 44.5% of adults reported having sigmoidoscopy or colonoscopy in the past 5 years, and 14.1% reported annual FOBT. [7] Various public education campaigns and strategies have been attempted to increase CRC screening rates in the underserved and underinsured populations, but poor adherence with stool tests, especially in the uninsured, remains a significant barrier to effective CRC screening.

Barriers to CRC screening reported by patients include practical issues such as being too busy, a lack of access to providers, the cost of the exam, being asymptomatic, embarrassment, and fear of finding polyps or cancer.[8] Other important barriers to implementing CRC screening in primary care practice settings include patients' lack of awareness of their risk for developing CRC and/or a lack of knowledge of screening options, particularly among poor and underserved populations.[9-13] Incomplete follow-up of positive FOBT results is another issue, as primary care physicians often fail to recommend optical colonoscopy to patients with positive FOBT results.[14-18]

The challenge of improving CRC screening adherence is even greater in large primary care practices, where time and resource limitations reduce the likelihood that physicians are able to adequately discuss CRC screening with their patients.[19] In a study by Wolf, only 9% of age-eligible patients at thirty-one Federally Qualified Health Centers (FQHCs) received a CRC screening recommendation from their physician and only 7% were adherent to screening, primarily through FOBT.[19] Difficulties cited include prioritization, time, resources, complexity of referral, and perceived acceptance of screening tests.[21] This project will include a culturally sensitive educational program on CRC for patients, as well as professional training on the importance and appropriate use of CRC screening in a primary care setting.

5-Year Expected Outcome for Provider and Patients:

It is expected that this project in DY2 – DY5 would:

- Increase the use of FIT as first-line CRC screening in the primary care setting.
- Increase patient knowledge regarding colorectal cancer incidence and available screening tools.
- Increase appropriate use of CRC screening modalities in primary care practice.

Starting Point/Baseline:

There is a multi-county need as data from the 2010 Behavioral Risk Factor Surveillance indicates that in Public Health Administrative Region 6/5S, only 38.6% of adults 50 years and older reported having ever had a sigmoidoscopy or colonoscopy in the past 5 years, and 13.9% reported annual fecal occult blood testing.[22] This is well below the ACS' 2015 goal of 75% of all adults over 50 having a recent CRC screening test.[39] The baseline for all milestones and metrics will be set at 0 as currently there are no programs to distribute FIT tests at the time of flu vaccination in the RHP3 counties beyond Harris County.

Rationale/Reason for selecting the program option:

CRC screening has been shown to save lives.[23] Screening prevalence is lower among people aged 50 to 64 compared to those 65 years and older, and is especially low among those who are non-white, who have fewer years of education, who lack health insurance coverage, and who are recent immigrants. [24] The 2010 National Healthcare Quality and Disparities Report indicates that Hispanics/Latinos undergo CRC screening at rates lower than African Americans and Whites, and thus are at great risk for presenting with late-stage disease at diagnosis.[25] Improving CRC screening in clinics serving indigent and Medicaid patients is a priority need, as these clinics are the primary source of care for a disproportionately high number of African American and Hispanic/Latino patients.[25] Low levels of knowledge about this topic have been linked with inaccurate CRC risk perceptions and low utilization of screening services. [26-33] The primary reason patients do not return FOBTs is that they do not believe they need screening if they have no symptoms of CRC. [12 -15, 34-35] These data underscore the need to implement innovative screening strategies.

Project Components:

Through the FIT-Flu Program, we propose to meet all required project components listed below and believe that the selected milestones and metrics relate to the project components:

a) Increase recommended CRC screening by means of an evidence based process to reach eligible patients unscreened for CRC and by offering professional education to assist primary care physicians in providing appropriate CRC screening recommendations to their patient population.
b) Establish collaborative partnerships with community organizations to ensure culturally competent patient education materials are disseminated and evidence based health professional training is utilized.
c) Educate patients on the risk factors and screening recommendations for CRC.
d) Increase access to CRC screening.
e) Conduct quality improvement using methods evaluate the ongoing effectiveness of the program.

Milestones & Metrics:

The following milestones and metrics have been chosen for the FIT-Flu Project based on the needs of the target population.

- Process Milestones and Metrics: P-1 [P-1.1]; P-2 [P-2.1]; P-4 [P-4.1]; P-X [P-X.1]; P-7[P-7.1]
- Improvement Milestones and Metrics: l-7 [l-7.1] [l-7.2] [l-7.3]

Customizable Process Milestones and Metrics were chosen to specifically tailor their intent to the project process.

Unique community need identification number the project addresses:

The project addresses the following unique community needs, as identified in the community needs assessment:

- CN.2 Inadequate access to specialty care.
- CN.11 High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease, including cancer, diabetes obesity, cardiovascular disease, asthma, and AIDS/HIV.
- CN.20 Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs.
- CN.22 Insufficient access to services that are specifically designed to address racial, ethnic and cultural health disparities.

- CN.23 Lack of patient navigation, patient and family education and information programs.

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:
This project will expand an existing FIT/Flu initiative in Federally Qualified Health Centers (FQHCs) in Harris County, extending this project into other RHP3 counties not currently served by this initiative. Additionally, the existing Harris County project would be included in DY4 and DY5, extending this project an additional two years.

Related Category 3 Outcome Measure(s):
OD-11 Addressing Health Disparities in Minority Populations
IT-11.3 Improve utilization rates of clinical preventive services (CRC screening) in target population with identified disparity. (Non-standalone measure)
a. Numerator: Number of individuals of target population reached by the FIT/Flu project
b. Denominator: Number of individuals in the target population
c. Data Source: Documentation of target population reached, as designated in the project plan
d. Rationale/Evidence: FIT-Flu intervention is a practical strategy with high potential to increase CRC screening adherence in community clinic settings. Individuals with low SES and minorities are more likely to die from colon cancer than those at higher SES levels
OD-12 Primary Care and Primary Prevention
IT-12.3 Colorectal Cancer Screening (HEDIS 2012)

a. Numerator: Number of adults aged 50 to 75 who have received one of the following screenings: Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, and colonoscopy every 10 years
b. Denominator: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.
c. Data Source: Data Source: Clinic EMR Rationale/Evidence: CRC is often curable if detected in its early stages but often fatal when diagnosed later. According to the Surveillance, Epidemiology and End Results (SEER) Program, patients diagnosed with Stage 1 disease (localized to the bowel wall) have a 90.1% 5-year survival rate compared to those with Stage 4 disease (distant metastases) who have an 11.7% 5-year survival rate.[36] Similar data are found in Texas with localized CRC showing an 88.1% 5-year survival and distant disease yielding a 13.2% 5-year survival. 37 CRC screening has been shown to save lives.[23] The United States Preventive Services Task Force (USPSTF) recommends the following CRC screening options for persons age 50-75 who are at average risk for the disease: (1) annual fecal occult blood testing (FOBT) using high-sensitivity stool guaiac tests or fecal immunochemical tests (FIT), (2) flexible sigmoidoscopy every 5 years plus FOBT or FIT every three years, or (3) optical colonoscopy every 10 years.

Reasons/Rationale for selecting the outcome measure(s):
One major goal outlined in NCI's Strategic Plan is to overcome disparities across the cancer control continuum from disease prevention to end-of-life care by studying and identifying factors contributing to disparities, developing culturally appropriate intervention approaches, and disseminating interventions.[38] Improving CRC screening in clinics serving low-income and underinsured patients is a priority need, as these clinics are the primary source of care for a disproportionately high number of African American and Hispanic/Latino patients.[25] With

decreasing rates of CRC screening in the uninsured Hispanic population and lower rates of screening and early detection among African Americans as compared to Whites, the FIT-Flu CRC screening initiative will increase adherence to USPSTF CRC screening guidelines through the use low-cost FOBT screening in the primary care setting. Moreover, this initiative offers a teachable moment for clinicians to create awareness of CRC risk factors and screening guidelines for an uninformed or misinformed population. Additionally, clinicians will be educated on the appropriate guidelines for CRC screening in their patient population.

Relationship to other Projects:
This project reinforces and extends an existing colorectal screening project of the Colorectal Cancer Workgroup, which is one of eight focus areas in the Comprehensive Cancer Control initiative in the Houston MSA.

Relationship to Other Performing Providers' Projects in the RHP:
The increase of primary care and specialty care will naturally result in additional ambulatory care encounters for our region patient base. The ambulatory initiatives cover items such as laboratory, PT/OT, social work, etc. and are a necessity of our patients to ensure a comprehensive treatment for access as well as cost avoidance. The Region 3 initiative grid in the addendum reflects all ambulatory operations initiatives.

Plan for Learning Collaborative:
We will participate in face-to-face learning such as meetings or seminars with other providers and the RHP, at least twice per year to promote collaborative learning around shared or similar projects. At each face-to-face meeting, we will collaborate to identify performance improvements and will ensure that these suggested improvements will be incorporated into our project processes.

Project Valuation: We have based our project valuation on California's 1115 Medicaid Waiver model. As such, we have valued our projects at 2.5 times that of the estimated costs. Basing our valuations on California's calculations we know we are well within the potential range of future cost savings when looking at the following from Prevention Institute and Trust for America's Health Issue Report entitled *Prevention for a Healthier America: Investments in Disease Prevention Yield Significant Savings, Stronger Communities (July 2008)*:

- Prevention can reduce end-of-life costs by increasing health during the lifespan, what researchers call the *compression of morbidity*.
- There is a substantial return-on-investment in prevention – For every $1 invested in community-based prevention, the return amounts to $5.60.

Project Option 2.7.2 – Implement innovative evidence-based strategies to reduce tobacco use – Evidence-Based Smoking Cessation Program for Underserved Persons Living with HIV/AIDS

Unique RHP Project ID: 112672402.2.2

Performing Provider Name/TPI: The University of Texas MD Anderson Cancer Center / 112672402

Project Summary:

Provider: The University of Texas MD Anderson Cancer Center is a comprehensive cancer center ranked first in cancer care by *U.S. News & World Report* and dedicated to patient care, education, research and prevention. MD Anderson is comprised of several Texas Medical Center campus locations, two research campuses in Bastrop County, Texas, four regional care centers and a number of national and international divisions and affiliates. More than 108,000 people—almost one-third of them new patients—were seen in FY2011. MD Anderson provided $215 million in uncompensated charity care to Texans in FY2011.

Intervention(s): This project will implement an evidence-based smoking cessation program for persons living with HIV/AIDS at the Legacy Community Health Services sites. Legacy provides care to approximately 40,000 underserved individuals (including 4,000 individuals living with HIV/AIDS) per year at five clinic sites in the greater Houston area. Legacy is also a nationally recognized leader in HIV/AIDS care.

Need for the project:

- This project addresses Community Needs: CN.6: Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly; CN.11: High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease including: cancer, diabetes, obesity, cardiovascular disease, asthma, and AIDS/HIV; CN.12 – High rates of tobacco use and excessive alcohol use.
- A wide range of studies have documented dramatically elevated rates of current smoking in HIV-positive populations, generally two to three times higher than the prevalence of smoking in the general population. Recent evidence indicates that smoking cessation among person with HIV could reduce the risk of overall mortality by almost 16%; reduce the risk of a major cardiovascular disease event by 20%; and reduce the risk of non-AIDS malignancies by 34%.

Target Population: One thousand patients living with HIV/AIDS will be enrolled in the smoking cessation program. While current smoking prevalence data are not available for the Legacy patient population, the estimated prevalence is 50%. This estimate is based on extensive existing literature documenting high smoking rates in this population. (Estimates range from 50 to 70%).

Category 1 or 2 expected patient benefits: The DY4 goal is enroll 50% of program eligible smokers into smoking cessation services. The DY5 goal is to disseminate the cell phone smoking cessation intervention to HIV care centers located throughout the RHP.

Category 3 outcomes:

IT-11.6: Other Outcome Improvement Target (Quit Attempts) – 75% of enrollees (n=750) will make a successful quit attempt

IT-11.6: Other Outcome Improvement Target (Smoking Cessation/Staying Quit) – 25% of smokers (n=250) will be abstinent at the time of follow-up

Project Option 2.7.2 – Implement innovative evidence-based strategies to reduce tobacco use - Evidence-Based Smoking Cessation Program for Underserved Persons Living with HIV/AIDS

<u>Unique RHP Project Identification Number</u>: 112672402.2.2
<u>Performing Provider Name/TPI</u>: The University of Texas MD Anderson Cancer Center / 112672402

<u>Project Description</u>:
The goal of the current proposal is to adapt, implement, and evaluate an evidence-based, cell phone-delivered smoking cessation treatment program targeted to low-income and underinsured individuals living with HIV/AIDS. The proposed smoking cessation project will involve a partnership with Legacy Community Health Services – a large, Federally Qualified Health Center (FQHC).

<u>Program overview</u>. In the first phase of our project, we will train Legacy staff to: 1) screen for current smoking, 2) identify eligible HIV+ smokers 3) offer smoking cessation treatment to eligible participants, and 4) administer the cessation intervention. Active recruitment will begin in phase 2. Participants who enroll in the program will meet with their HIV Case Manager and treatment materials (call calendar and nicotine replacement patches) will be dispersed. The final phase of the project will consist of follow-up assessment and dissemination to other HIV care centers in the RHP.

<u>Treatment overview</u>. Enrollees will be given brief advice to quit smoking and offered nicotine replacement therapy (NRT) in the form of nicotine patches. Enrollees will then receive a series of proactive telephone counseling sessions that will be conducted over a six month time period. This evidence-based treatment approach is based on the United States Public Health Service (USPHS) Guidelines and our previous work with HIV+ smokers.[1-3] Extensive evidence supports the efficacy of NRT. We have chosen to use nicotine patches due to their ease of use and low risk of side effects. When combined with provider advice to quit smoking, NRT effectively doubles the odds of successfully quitting.[2] For the phone counseling component, we have chosen to use the approach developed in our earlier clinical trial. Counseling session content is primarily drawn from cognitive-behavioral and motivational interviewing techniques. Importantly, content is tailored to the individual's HIV status, and addresses HIV-specific issues.

Assessments, which will include smoking status measures, psychosocial measures, and process variables, will be conducted in the Legacy clinics at the time of program enrollment, and at 3- and 6-months post enrollment. After all program participants have completed the 6-month follow-up, a detailed program evaluation will be conducted.

<u>Community Partner</u>. For this project, we will partner with Legacy Community Health Services. Legacy provides care to approximately 40,000 underserved individuals (including 4,000 individuals living with HIV/AIDS) per year at five clinic sites in the greater Houston area. Legacy is also a nationally recognized leader in HIV/AIDS care. Providers (intake nurses and case managers/social workers) at the clinic sites will assist with screening and smoking cessation intervention delivery. We have a strong record of this type of collaboration as evidenced by our previous research initiatives at Thomas Street Health Center of the Harris Health System.

Goal(s) and Relationship to Regional Goals(s):

Aim 1: Adapt a previously developed smoking cessation treatment approach for use with Legacy Community Health Service's HIV+patient population.

Our goal is to work with Legacy staff to adapt our proactive cell phone counseling intervention so that program implementation will minimize clinic flow disruption, while appealing to a majority of the target population. If successful, our program will be readily implemented, maintained, and administered by the Legacy clinic sites and, ultimately, disseminable to other HIV-care centers across the RHP.

Aim 2: Implement an evidence-based smoking cessation program for persons living with HIV/AIDS at the Legacy clinic sites.

Our goal is to screen, enroll, and provide smoking cessation treatment (consisting of brief provider advice to quit, nicotine replacement therapy, and proactive phone counseling) to 1000 smokers receiving HIV care at the 5 Legacy clinic sites.

Aim 3: Evaluate the effectiveness of the smoking cessation program implemented at Legacy.

Our goal is to evaluate the following:

- ***Reach** of the smoking cessation program - defined as the proportion of identified HIV-positive smokers who enroll in the program.*
- ***Efficacy** of the program - defined as the proportion of smokers who successfully quit smoking.*
- ***Implementation** of the program – defined as: 1) proportion of Legacy patients screened for program eligibility; 2) proportion of scheduled counseling calls completed by Case Managers; 3) dose of counseling treatment per participant (proportion of scheduled calls);and 4) dose of nicotine replacement therapy (NRT) per participant (proportion of NRT patches used).*
- ***Costs** – cost analysis, cost-effectiveness analysis, and cost utility analysis of the treatment program will be performed.*

Regional Goal. This proposed project is responsive to the first regional goal, "Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health outcomes and patient satisfaction." At the present time, Legacy Community Health Services (an FQHC providing care to the underserved population in the greater Houston area) does not systematically screen smoking status, or offer smoking cessation services. Thus, the proposed project will fill an important gap. An existing evidence-based treatment will be offered to HIV+ smokers, while non-HIV+ positive smokers will be referred to the Texas Quitline. Moreover, the treatment provided to the HIV+ smokers will be administered through the HIV Case Management service already in place at Legacy.

Challenges:

Major challenges of the project include the following: 1) obtaining buy-in from staff at Legacy, 2) overcoming barriers to smoking cessation treatment, and 3) offering a sustainable program. We have carefully considered each of these challenges in the design of the project. First, buy-in will be facilitated by the support we have already received from Legacy Leadership. Specifically, Dr. Richard Beech, Chief Medical Officer, strongly supports this program and is fully committed to our initiative. Also, a key collaborator on this project, Dr. Leonard Zwelling, Professor, Experimental Therapeutics at MD Anderson Cancer Center serves on the Board of Directors at Legacy. Thus, he will be able to facilitate communications between project investigators and Legacy leadership. Second, the design of the project itself overcomes many barriers to treatment

commonly experienced by underserved HIV+ smokers. Key program elements, such as use of cell phones for treatment delivery, use of NRT (vs. other medications), and eliminating extra clinic visits, are each designed to minimize barriers, potential hazards, and overall participant burden. Third, a crucial component of the project is the training of case managers to deliver and administer the cessation program. Thus, the personnel resources will remain after the funding for the program ends. In addition, the program will ultimately be appropriate for a large number of HIV care centers.

5-Year Expected Outcome for Provider and Patients:
We believe our program will result in: 1) enhanced screening for smoking, 2) promote the delivery of evidence-based smoking cessation treatment, 3) promote quit attempts among participants receiving treatment, 4) reduce the prevalence of current smoking, and ultimately 5) reduce morbidity and mortality of smoking-related malignancies in the HIV-positive population.

Starting Point/Baseline: Patients will be recruited from the population of individuals receiving care at the Legacy Community Health Services, a Federally Qualified Health Center with a national reputation as a leader in HIV/AIDS prevention and treatment. Legacy provides care to approximately 40,000 patients, including more than 4,000 persons living with HIV/AIDS. Currently, smoking status is not systematically assessed, nor is cessation treatment offered. The HIV+ patient population is racially/ethnically diverse (33% Black/African American; 33% White; and 26% Hispanic). Approximately 70% of the patients are male, and 78% are between the ages of 25 and 54 years. Finally, 47% of the population is gay or bisexual and 44% are heterosexual.

We plan to enroll 1000 patients in the smoking cessation program. While current smoking prevalence data are not available for the Legacy patient population, we estimate a prevalence of 50%. This estimate is based on the extensive existing literature documenting high smoking rates in this population (estimates ranging from 50 to 70%),[4-8] as well as anecdotal reports from Legacy clinic staff ("at least 50% of the patients smoke"). We estimate, conservatively, that 50% of the HIV/AIDS patients screened at the Legacy clinics will be current smokers (that is 2000 of the 4000 HIV+ patients treated at Legacy). We would, therefore, need to enroll approximately 50% of these patients to reach our target of 1000. Given our ability to consistently enroll approximately 66% of smokers in our previous and ongoing studies with HIV+ smokers, a goal of 50% in the proposed program is readily achievable. In addition, non-HIV positive smokers will be referred to the Texas Quitline.

Rationale:

Cigarette smoking among persons living with HIV/AIDS represents a significant public health problem. A wide range of studies have documented dramatically elevated rates of current smoking in HIV-positive populations, generally two to three times higher than the prevalence of smoking in the general population.[4,6-8] Recent evidence indicates that smoking cessation among persons with HIV could reduce the risk of overall mortality by almost 16%; reduce the risk of a major cardiovascular disease event by 20%; and reduce the risk of non-AIDS malignancy by 34%.[9] Despite the high prevalence of current smoking and the substantial health benefits offered by smoking cessation treatment, surprisingly few efforts to deliver cessation treatment to this population appear in the literature.[10]

In previous efforts, Dr. Vidrine and colleagues have developed and performed efficacy assessments of behavioral interventions consisting of proactive cell phone-delivered smoking cessation counseling for HIV+ smokers. Findings from these efforts indicate that this treatment approach significantly increases abstinence rates over usual care (see preliminary evidence section) in the HIV-positive population. Despite the positive findings, much room for program dissemination and treatment improvement exists.

Several key factors were considered in the design of the proposed smoking cessation program. First, the proposed intervention (brief advice to quit, proactive cell phone counseling + NRT) builds on a solid, evidence-based foundation. This intervention has yielded positive results in earlier studies targeting underserved persons with HIV. Moreover, the efficacy of proactive phone counseling interventions and NRT have been extensively established in the general population. Second, the proposed intervention successfully overcomes many barriers to other interventions. For example, barriers such as limited transportation, housing instability, treatment costs, lack of landline/internet access, and limited literacy will not prevent participation in the proposed program. Finally, we have chosen to offer NRT as a component of the treatment. NRT is effective and offers several advantages over other potential pharmacotherapies (i.e., bupropion and varenicline), including fewer potential interactions with antiretroviral medications and less risk of psychiatric side effects. NRT is also available at no (or greatly reduced) cost to Legacy patients.

Project Components:
We believe our program will result in: 1) enhanced screening for smoking [P-X], 2) promote the delivery of evidence-based smoking cessation treatment [P-2], 3) promote quit attempts among participants receiving treatment [P-X], 4) reduce the prevalence of current smoking [IT-11.1], and ultimately 5) reduce morbidity and mortality of smoking-related malignancies in the HIV-positive population [IT-11.6].

Milestones & Metrics:
The following milestones and metrics have been chosen for the Smoking Cessation Program for Underserved Persons Living with HIV/AIDS:

- Process Milestones and Metrics: P-X (P-X.1); P-1 (P-1.1); P-2 (P-2.1); P-7 (P-7.1., P-7.2)
- Improvement Milestones and Metrics: I-5 (1-5.1); OD-11 (IT-11.1, IT-11.6)

Unique community need identification number the project addresses:
The project addresses the following unique community needs as identified in the community needs assessment:

- CN.6 – Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly
- CN.11 – High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease including: cancer, diabetes, obesity, cardiovascular disease, asthma, and AIDS/HIV
- CN.12 – High rates of tobacco use and excessive alcohol use

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:
An innovative component of our program is the use of case managers as program stakeholders. HIV case management is a client-focused process that delivers, expands, and coordinates services to clients. Generally stated, the ultimate goal of HIV case management is to help

patients achieve better levels of physical, emotional, and social functioning.[11] The literature indicates that HIV case management can result in a number of improved health outcomes, particularly for individuals with complex health care needs, including improved quality of life.[12] Therefore, offering smoking cessation counseling fits well within the mission of the case management discipline. In addition, input from clinical staff at Legacy indicated that an intervention that utilizes the already established case management service would be ideal. Finally, because case management is available in most HIV clinics, our approach may have higher dissemination potential than alternative approaches. For example, The Ryan White Care Act currently provides funding to more than 2500 organizations, and case management services to more than 500,000 HIV-positive individuals.

Related Category 3 Outcome Measure(s):

IT-11.6 Other Outcome Improvement Target: Quit attempt

- 75% of enrollees (n=750) will make a successful quit attempt.

IT-11.6 Other Outcome Improvement Target: Smoking cessation/Staying Quit

- 25% of smokers (n=250) will be abstinent at the time of follow-up

Reasons/rationale for selecting the outcome measure(s):

Several important factors support our choice of OD-11 as our category 3 outcome domain. First, HIV/AIDS is among the conditions with the greatest disparities in health services and quality.[13] Education, income, and employment status, along with race/ethnicity have been identified as important independent predictors of HIV/AIDS status.[14,15] For instance, AIDS incidence and mortality are disproportionately high among African American and Hispanic individuals. African Americans and Hispanics account for approximately one quarter of the total U.S. population; however, these same two groups account for more than two thirds of the reported cases of AIDS.[16] This translates to a rate among African Americans that is more than 8 times higher than the rate for whites, and the rate for Hispanics is 3 times higher compared to whites.[16] Therefore, reducing the disproportionate impact of HIV/AIDS among traditionally underserved populations and improving health outcomes for people living with HIV/AIDS are national priorities.[17,18]

A second important consideration is high prevalence of current smoking among people living with HIV/AIDS. Numerous reports describing dramatically elevated rates of smoking (40-70%) in this special population appear in the scientific literature. [e.g.,6-8] There are several characteristics that are known to be associated with both smoking status and HIV serostatus. Education level, income, and employment status have been identified as important independent predictors of both HIV/AIDS and smoking status.[14,15] Certain behavioral and psychosocial variables (e.g., sexual orientation, heavy alcohol consumption, illicit drug use, and depressive symptoms) are also associated with both smoking status and HIV/AIDS.[19-22] While smoking is a hazardous behavior for all populations, HIV+ individuals appear to be particularly susceptible to the adverse health effects of tobacco use.[23] In addition to increasing the risk of various pulmonary conditions and oral infections, [24-32] smoking significantly elevates the risk of cancer among individuals with HIV.[33-37] For example, anal, cervical, and lung cancers are observed significantly more often among HIV+ smokers compared to nonsmokers.[33,37-39]

Despite the high prevalence of smoking and the increased risk of numerous adverse health outcomes, efforts to deliver cessation treatment to persons living with HIV/AIDS are rare.[10] In fact, our community partner for the proposed project serves one of the largest HIV+ patient populations in the state, yet currently has no smoking cessation program available to these patients. Therefore, offering an evidence-based cessation program presents the potential to

reduce smoking prevalence in the Legacy patient population, resulting in fewer smoking-related diseases and poor health outcomes.

Relationship to other Projects: By delivering an evidenced based smoking cessation program to the underserved population of HIV+ smokers at Legacy Community Health Services, this program is in line with the RHP. This project also supports our other projects in that they all support one of the eight goals of the Comprehensive Cancer Control Program at The University of Texas MD Anderson Cancer Center.

Relationship to Other Performing Providers' Projects in the RHP:
Innovation is key to the transformation of healthcare in our community. The consistency of innovation in our region allows for increased improvements based on research trends, patient need, and provider availability. The waiver funding allows for innovation in specific areas and all innovative projects included in the plan are similar in the fact of program redesigns for historic treatments, and focus to chronic condition outcome measures such as central line infections. The Region 3 initiative grid in the addendum can provide a side by side comparison of all projects that directly relate to innovation.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for RHP3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation: We have based our project valuation on California's 1115 Medicaid Waiver model. As such, we have valued our projects at 2.5 times that of the estimated costs. Basing our valuations on California's calculations we know we are well within the potential range of future cost savings when looking at the following from Prevention Institute and Trust for America's Health Issue Report entitled *Prevention for a Healthier America: Investments in Disease Prevention Yield Significant Savings, Stronger Communities (July 2008)*:

- Prevention saves money – an investment of $10 per person per year in programs to increase physical activity, improve nutrition, and prevent tobacco use could save the country more than $16 billion in annual health care costs within five years.
- Prevention can reduce end-of-life costs by increasing health during the lifespan, what researchers call the *compression of morbidity*.

There is a substantial return-on-investment in prevention – For every $1 invested in community-based prevention, the return amounts to $5.60.

Project Option 2.7.2 – Implement innovative evidence-based strategies to reduce tobacco use – Multimedia Tools and Community Engagement for Youth Early Tobacco Prevention and Cessation

Unique RHP Project ID: 112672402.2.3

Performing Provider Name/TPI: The University of Texas MD Anderson Cancer Center / 112672402

Project Summary:

Provider: The University of Texas MD Anderson Cancer Center is a comprehensive cancer center ranked first in cancer care by *U.S. News & World Report* and dedicated to patient care, education, research and prevention. MD Anderson is comprised of several Texas Medical Center campus locations, two research campuses in Bastrop County, Texas, four regional care centers and a number of national and international divisions and affiliates. More than 108,000 people—almost one-third of them new patients—were seen in FY2011. MD Anderson provided $215 million in uncompensated charity care to Texans in FY2011.

Intervention(s): A Smoking Prevention Interactive Experience (ASPIRE) will be utilized to reach underserved, at-risk youth at various access points in RHP3 counties. Youth will be exposed to multilingual, culturally relevant anti-tobacco messages using electronic, digital and print media. Youth tobacco users and nonusers will join in the initiative and be exposed to five modules of tobacco prevention and cessation education.

Need for the project:

- This project addresses Community Needs in RHP3: CN.11-High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease including: cancer, diabetes, obesity, cardiovascular disease, asthma, and AIDS/HIV; CN.12 – High rates of tobacco use and excessive alcohol use; CN.20 – Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs; CN.22-Insufficient access to services that are specifically designed to address racial, ethnic and cultural health care disparities; CN.23-Lack of patient navigation, patient and family education and information programs.
- In the state of Texas, over one third of students use tobacco products and at least two thirds of middle and high school students reported they were not exposed to anti-smoking messages.

Target Population: Ten percent of Medicaid-eligible youth (11-18 years old) will be enrolled in up to three counties per year within the RHP3. The facilities targeted for provider training will be school-based student health clinics, as well as schools, community centers, faith organizations, and juvenile detention facilities.

Category 1 or 2 expected patient benefits:

- The DY4 goal is to implement evidence-based innovative ASPIRE program among adolescents in Chambers and Matagorda counties – 10% Improvement over DY3.
- The DY5 goal is to implement evidence-based innovative ASPIRE program among adolescents in Waller and Wharton counties – 20% over DY3.

Category 3 outcomes:

IT-11.6: Other Outcome Improvement Target – Improve utilization rates of the tobacco prevention and cessation program (ASPIRE) in adolescents aged 11 to 18 years of age.

Project Option 2.7.2 - Implement innovative evidence-based strategies to reduce tobacco use - Multimedia Tools and Community Engagement for Youth Early Tobacco Prevention and Cessation

Unique Project ID: 112672402.2.3
Performing Provider Name/TPI: The University of Texas MD Anderson Cancer Center / 112672402

Project Description:
Tobacco is the number one preventable cause of death from cancer and other diseases. Nearly all tobacco use begins during the teenage years. Low-income, underserved youth are at highest risk for becoming tobacco users. For these reasons, we will target individuals aged 11 to 18 years and propose a tobacco prevention and cessation initiative utilizing multimedia resources as well as an extensive community network.

The program would prevent smoking initiation and facilitate early cessation among those accessible in middle- and high-schools as well as for those inaccessible in schools (e.g., school dropouts, absentees, and transfers). Our evidence-based online tobacco program ASPIRE (A Smoking Prevention Interactive Experience) is free to the public and sustainable. It will serve as the primary resource for this project. ASPIRE will be utilized to reach underserved, at-risk youth at various access points in Regional Health Partnership (RHP) 3 counties. Youth will be exposed to multilingual, culturally relevant anti-tobacco messages using electronic, digital and print media. By the end of year 5 we anticipate enrolling more than 60,000 adolescents in RHP3 counties into the ASPIRE program.

Goal(s) and Relationship to Regional Goal(s):
This project will influence knowledge, attitudes, and perceptions of young people about tobacco products. Receipt of ASPIRE's health education, in turn will lead to reduced consumption of tobacco products and incidence of tobacco-related disease among participants, thereby increasing the future health and wellbeing of Region 3 adolescents.

This initiative will employ a range of activities and services to include: youth engagement through school-based events, Facebook/online advertising, and other group activities; community outreach with incentives/contests around national anti-tobacco events, youth education and counseling (including expectant teen mothers), parental /family and community involvement and provider/educator training. Furthermore, our concept will require the involvement of the following facilities: middle and high schools, clinics (e.g., WIC, family planning, STD), community centers, faith organizations, congregation spaces and juvenile detention facilities. Examples of providers include: administrative and educational personnel in schools, community leaders, congregation leaders, counselors, social workers and nurses.

This project meets the following regional goals:

- Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages patients, providers, and other stakeholders in the planning, implementation, and evaluation processes.

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.

.

Challenges:
A main challenge will be the recruitment and retention of youth (i.e., maintaining their interest, motivation and commitment to the program). Secondarily, technology can pose its own challenges (e.g. glitches, bandwidth, software compatibility, etc.). Another challenge is related to the consistency of ASPIRE implementation among our partners. These obstacles can be successfully addressed by the implementation team. They have considerable experience in working with young, disadvantaged populations and intervention delivery. The director of this initiative, Dr. Alex Prokhorov has 30 years of experience in preventing youth tobacco use among underserved populations. We plan to also leverage the expertise of the following collaborators: Dr. Ellen Gritz (international leader in tobacco control), Dr. Damon Vidrine (expertise in mHealth/eHealth), Dr. Karen Calabro (education/smoking in young populations), Salma Marani (biostatistician for various tobacco and youth studies), and Lauren McCoy (health marketing/communications professional). Another strategic advantage for this initiative is the provision of resources that can compensate both individual participants and member partners (i.e., furnishing computer resources to facilitate youth viewing of ASPIRE within partner facilities).

5-Year Expected Outcome for Provider and Patients:
Our intent is to disseminate ASPIRE on a per-county basis. We plan to enroll 10% of Medicaid-eligible youth in up to three counties per year. Youth tobacco users and nonusers will join the initiative and be exposed to five modules of tobacco prevention and cessation education. In the past, ASPIRE participants nationwide have indicated that: (1) 92% learned new facts about the risks associated with tobacco, (2) 84% reported that ASPIRE influenced them not to use tobacco in the future, and (2) 92% have reported a greater understanding of how tobacco affects their health, the health of their family and friends. We expect the same level of engagement and receptivity to ASPIRE in Region 3.

Starting Point/Baseline:
The ASPIRE initiative is an existing program with widespread reach. Within the Houston area, 4,100 adolescents are engaged in ASPIRE or have been exposed to ASPIRE (year-to-date from 2008 to August 2012).

Rationale:
Project option 2.7.2 was selected because ASPIRE is an evidence-based program proven to reduce the uptake of tobacco use among underserved teenagers at highest risk for smoking initiation.

In the state of Texas, over one third of students use tobacco products and at least two thirds of middle and high school students reported they were not exposed to anti-smoking messages. Concurrently, youth are known to be heavy users of technology. For these reasons we will specifically focus on reaching underserved youth within Region 3 counties using a technology-based program that is evidence-based for high-risk adolescents. ASPIRE was tested among inner-city youth in urban Houston high schools and proved to be effective in preventing

smoking initiation. The program is used by adolescents in counties within Texas, is easily accessible with Internet access and is available at no cost to users. Additional funding will allow us to enhance the sustainability of ASPIRE and to offer better incentives for broader program participation. Additionally, the ASPIRE program can be easily implemented as it is self-directed for the students.

Project Components:
The activities of this initiative include efforts to train providers and community partners to consistently refer adolescents to tobacco prevention and tobacco cessation, which can lead to widespread delivery of tobacco prevention services in the RHP3 counties [P-6; IT-11.6]. The facilities targeted for provider training will be school-based student health clinics, as well as schools, community centers, faith organizations, and juvenile detention facilities.

Milestones & Metrics:
The following milestones and metrics were selected for the ASPIRE youth tobacco use prevention and cessation project based on the needs of the target population:

- Process Milestones and Metrics: P-2 (P-2.1); P-7 (P-7.1)
- Improvement Milestone and Metric: I-5 (I-5.1)

Unique community need identification number the project addresses: The project addresses the following unique community needs as identified in the Region 3 community needs assessment:

- CN.11- High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease, including
  - Cancer
  - Diabetes
  - Obesity
  - Cardiovascular disease
  - Asthma
  - AIDS/HIV
- CN.12 - High rates of tobacco use and excessive alcohol use
- CN.20 - Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs
- CN.22 - Insufficient access to services that are specifically designed to address racial, ethnic and cultural health care disparities
- CN.23 - Lack of patient navigation, patient and family education and information programs.

How the project represents a new initiative for the Performing Provider or significantly enhances an existing deliver system reform initiative:
Currently, there is no evidence-based tobacco prevention and cessation program that is available to teens in RHP3 counties at no cost to participants. This initiative will not only introduce this culturally-tailored resource to adolescents, but also provide access to tobacco education in support of positive health outcomes. During this initiative, we also plan to have bi-annual meetings with other RHP providers to contribute to the sharing of ideas and identifying best practices for the region.

Related Category 3 Outcome Measure(s):

OD-11 Addressing Health Disparities in Minority Populations:

- IT-11.6: Improve utilization rates of the tobacco prevention and cessation program (ASPIRE) in adolescents aged 11 to 18 years.
  - Numerator: Number of adolescents to enroll in program
  - Denominator: Number of adolescents
  - Data Source: ASPIRE administrative data system (numerator) and TBD (denominator)

Reasons/rationale for selecting the outcome measure(s):

Based on the options available, we believe the ASPIRE initiative is compatible with this Category 3 outcome measure because ASPIRE provides access to preventive services virtually non-existent in these communities. The ASPIRE program was tested with an 18-month randomized controlled study among 1160 ethnically diverse students from 16 inner-city high schools in Houston. About 6% of control group participants initiated smoking whereas < 2% of the intervention group initiated smoking ($p < .05$).[256] According to the 2010 U.S. Bureau of the Census, there are approximately 1.4 million adolescents residing in RHP3 counties. Within this figure, we conservatively estimate that nearly 350,000 young within this group (i.e., 25%) are covered by Medicaid.

Relationship to Other Projects:

By delivering a tobacco use prevention and cessation program to youth, this project, like our other projects, supports one of the eight goals of the Comprehensive Cancer Control Program at MD Anderson Cancer Center.

Relationship to Other Performing Providers' Projects in the RHP:

Healthcare treatment cannot focus to only the acute or chronic encounter and properly treat the patient. It is critical that our region focuses to patient education and community education to ensure a proactive and responsive approach to healthcare needs. The education models represented in the Region 3 RHP plan can be identified in the Initiative Grid (addendum) and all focus to outcome measures such as appropriate utilization, patient satisfaction scores, and standalone chronic condition scores such as diabetes and asthma.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for RHP 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation: We have based our project valuation on California's 1115 Medicaid Waiver model. As such, we have valued our projects at 2.5 times that of the estimated costs. Basing our valuations on California's calculations we know we are well within the potential range of future cost savings when looking at the following from Prevention Institute and Trust for America's

[1.] Prokhorov, A. V., Kelder, S. H., Shegog, R., Murray, N., Peters, R., Jr., Agurcia-Parker, C., Hudmon, K. S. (2008). Impact of A Smoking Prevention Interactive Experience (ASPIRE), an interactive, multimedia smoking prevention and cessation curriculum for culturally diverse high-school students. *Nicotine Tob Res, 10*(9), 1477-1485

Health Issue Report entitled *Prevention for a Healthier America: Investments in Disease Prevention Yield Significant Savings, Stronger Communities (July 2008)*:

- Prevention saves money – an investment of $10 per person per year in programs to increase physical activity, improve nutrition, and prevent tobacco use could save the country more than $16 billion in annual health care costs within five years.
- Prevention can reduce end-of-life costs by increasing health during the lifespan, what researchers call the *compression of morbidity*.

There is a substantial return-on-investment in prevention – For every $1 invested in community-based prevention, the return amounts to $5.60.

Unique Identifier: 112672402.2.3	***RHP PP Reference Number:** 2.7.2*	***Project Components:** 2.7.2*	***Project Title:** Implement innovative evidence-based strategies to reduce tobacco use - Multimedia Tools and Community Engagement for Youth Early Tobacco Prevention and Cessation*

Project Option 2.7.1 – Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations (e.g., mammography screens, colonoscopies, prenatal alcohol use, etc.): Expand Project VALET
Unique RHP Project ID: 112672402.2.4
Performing Provider Name/TPI: The University of Texas MD Anderson Cancer Center / 112672402 **Project Summary:**
Provider: The University of Texas MD Anderson Cancer Center is a comprehensive cancer center ranked first in cancer care by *U.S. News & World Report* and dedicated to patient care, education, research and prevention. MD Anderson is comprised of several Texas Medical Center campus locations, two research campuses in Bastrop County, Texas, four regional care centers and a number of national and international divisions and affiliates. More than 108,000 people—almost one-third of them new patients—were seen in FY2011. MD Anderson provided $215 million in uncompensated charity care to Texans in FY2011.
Intervention(s): This project will expand Project VALET (Providing Valuable Area Life-Saving Exams in Town), a breast cancer screening mammography service for uninsured women, ages 40 and older in Houston, to the RHP3's coverage area.
Need for the project: **A)** This project addresses the following unique community needs in the RHP3: CN.2-Inadequate access to specialty care; CN.11-High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with cancer; CN.20-Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs; CN.21-Inadequate transportation options for individuals in rural areas and for indigent/low-income populations; CN.22-Insufficient access to services that are specifically designed to address racial, ethnic, and culturally health disparities. **B)** This program has consistently increased the numbers of uninsured and low-income women – especially racial/ethnic minorities, such as Hispanic and African American – getting screened for breast cancer. Since its inception, Project VALET has demonstrated that despite Houston's vast medical services, the percentage of women in need of breast cancer screening is still high (36%). Barriers to care, such as lack of transportation, partially explain low screening rates in this population. Currently, the number of screening appointments needed exceeds the available screening capacity.
Target Population: Women within the RHP3 counties eligible to participate in Project VALET are those 40 years of age or older, asymptomatic and without medical insurance. Women must also receive a clinical breast exam at one of the participating clinics before scheduling with MD Anderson Mobile Mammography Appointment Line.
Category 1 or 2 expected patient benefits: The DY4 goal is to increase number of target population receiving breast cancer screening by 50% over DY3 (Screen 1,200 women for breast cancer). The DY5 goal is to increase number of target population receiving screening by 25% over DY4 by extending project in two additional RHP area clinics (Screen 1,600 women for breast cancer).
Category 3 outcomes: **IT-11.1**: Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (Standalone Measure). Number of women who are assessed for eligibility for a screening mammogram, during the clinic intake and number of women seen in the participating clinics who receive a well-woman exam. **IT-12.1**: Breast Cancer Screening (HEDIS 2012) Number of women, ages 40 to 70, who have received an annual mammogram during the reporting period and number of women ages 40 to 70 in service area who meet Project VALET's eligibility criteria.

~~**Project Option 1.1.3 – Expand Mobile Clinics – Expansion of Project VALET of Screening Mammograms**~~

Project Option 2.7.1 Implement innovative evidence-based strategies to increase appropriate use of technology and testing for targeted populations (e.g., mammography screens, colonoscopies, prenatal alcohol use, etc.) – Expansion of Project VALET of Screening Mammograms

Unique Project ID: 112672402.2.4
Performing Provider Name/TPI: The University of Texas MD Anderson Cancer Center / 112672402
Project Description:

The University of Texas MD Anderson Cancer Center (MD Anderson), in partnership with The Rose, a non-profit breast organization, and the Houston Department of Human and Health Services (HDHHS), will expand Project VALET (Providing Valuable Area Life-Saving Exams in Town), a breast cancer screening mammography service for uninsured women, ages 40 and older in Houston, to the RHP3's coverage area.

For the past four years, Project VALET has relied on the MD Anderson Breast Clinic's availability to provide screening dates with their sole digital mobile mammography van. Since the majority of the Breast Clinic's screening dates are reserved for long-standing corporate clients and clinics, the acquisition of a new mobile van would enable Project VALET to increase its screening capacity, thus reaching a broader base of at-risk populations and expanding its geographic coverage to include neighboring clinics within the RHP3 area.

Project VALET's overall goals align with the regional goals since they will leverage existing programs which offer well-woman exams and enhance them by providing free screening mammograms to underserved populations that might not otherwise have access to this specialty care or the ability to pay for it. Doing so will increase the number of underserved and uninsured women in the RHP3 who receive a clinical breast exam and screening mammogram, especially those who have not been compliant with the recommended American Cancer Society (ACS) screening guidelines for the early detection of breast cancer. (The ACS guidelines used for breast cancer are an annual clinical breast exam for asymptomatic women age 40 and older as a part of a periodic health examination as well as annual mammography) (1). This implements best-practices and maximizes the use of technology. This will reinforce patients to adopt preventive health care measures and in the process, positively impact breast cancer outcomes.

Target Population and Eligibility: To be eligible to participate in Project VALET, a woman must be 40 years of age or older, asymptomatic and without medical insurance. (Citizenship or legal residency status will not be requested.) After receiving a clinical breast exam at one of the participating clinics, women meeting the eligibility criteria will be given the phone number to the MD Anderson Mobile Mammography Appointment Line and information on what to expect on the day of the screening event. (The information will be available in English and Spanish.) It is the woman's responsibility to schedule her screening mammogram. MD Anderson Mobile Appointment Line staff members will make a reminder call to the patient 24-hours in advance of her appointment. On the screening day, the patient will complete her registration forms and receive an educational packet with breast health information and a list of organizations that can provide diagnostic tests and/or treatment if needed. Two to three weeks after the screening event,

both the patient and her referring clinic will receive a copy of the screening result. If the result is negative, the woman is encouraged to return for an annual screening mammogram. If positive, the community health worker (CHW) will navigate the woman to the appropriate service(s).

Goal(s) and Relationship to Regional Goal(s):
The goal of this project is to utilize an evidence-based approach in RHP 3 clinics to increase breast cancer screening to women, ages 40-70, who qualify for a free, breast screening mammogram. Culturally appropriate material will be distributed to all women who go in for a well-woman exam.

To ensure the success of this project, the program manager will train clinic staff and CHWs on the process of how to obtain a screening mammogram; ensure that proper data and documentation is being collected; attend screening events to help register patients and answer any questions that might arise.
Project Goals:

- Assess the number of women who have previously received a screening mammogram
- Increase the number of uninsured, underserved women who have received a screening mammogram in RHP3
- Establish base-line mammograms for traditionally non-compliant populations
- Increase the frequency and geographical range of screening mammogram events in the RHP3

This project meets the following Region 3 goals:

- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.

The Project VALET Expansion program aims to reduce the incidence and mortality of breast cancer by offering free screening mammograms to women who qualify, in a participating neighborhood clinic. This project will be implemented in three counties within the RHP3 geographic area. Clinics targeted are: Houston Department of Health and Human Services, Federally Qualified Health Centers (FQHCs), and other clinics that provide well-woman exams.

Challenges:
Internal challenges: First and foremost, all program planning and implementation hinges on purchasing a new, digital mobile mammography van, without which, it is impossible to add more screening dates and/or clinics. This will also enable us to add screening dates since we have reached the maximum amount of days available with the current van. In addition, a new van will provide back-up van when mechanical issues arise with the primary van. (Historically, Project VALET cancels an average of four to five screenings per year due to this problem.) A secondary challenge is identifying clinics in neighboring RHP3 regions that offer well-woman services while meeting the MD Anderson Mobile Mammography van's primary criteria that screening sites must be within a 45-mile radius from the hospital. Though this will limit the number of clinics we can partner with in the RHP3 geographical area, for those clinics that meet the site criteria, we will be able to provide screening services in neighborhoods that have traditionally been without such services.

External challenges: Working with different clinics might impact the ability to collect complete clinical breast exam and screening data on an ongoing basis, especially when clinics

have staff transitions and/or reductions (we have faced both situations in our partnership with HDHHS). Furthermore, the clinics might not have the technical capability to do this. The program will offer to pay for technical upgrades to facilitate data collection.

Another challenge is recruiting women who are unaccustomed to seeking preventive care because of financial barriers or the fear of getting screened without resources for diagnostic testing and/or treatment, should they need them. The CHWs will create educational folders with breast cancer information and help navigate the patient in finding resources for low-cost or free services that might be needed. The CHWS and the program manager will be available for additional questions or issues that might arise.

Environmental challenges: Inclement weather (e.g., heavy rainfall) typically increases the no-show rate because some of the patients take public transportation or walk to the screening events.

Five-year Expected Outcome for Provider and Patients:

- Increase the number of uninsured, underserved women adhering to ACS' breast cancer screening guidelines
- Establish base-line mammograms for traditionally non-compliant populations
- Increase the frequency of screening mammogram events in RHP3

Starting Point/Baseline:

From June 2008 to August 2012, Project VALET has provided 1,205 screening mammograms from approximately 1,500 encounters with potential participants. Ninety percent of the providers affiliated with this program have received training on how to implement Project VALET. Since this is an expansion project, the baseline will be determined after an initial period of operation.

Rationale:

Project VALET was selected because it has been successfully implemented on a smaller scale in the City of Houston. Furthermore, this program has consistently increased the numbers of uninsured and low-income women – especially racial/ethnic minorities, such as Hispanic and African American – getting screened for breast cancer. Since its inception, Project VALET has demonstrated that despite Houston's vast medical services, the percentage of women in need of breast cancer screening is still high (36%) (2). Barriers to care such as lack of transportation partially explain low screening rates in this population (3). Currently, the number of screening appointments needed exceeds the available screening capacity.

More than 2,800 women are expected to die this year in Texas as a result of breast cancer (4) and many of the women who die will present with late stage disease because they did not participate in breast cancer screenings (5). Breast cancer death rates are highest for Black women (6). Indigent/low-income women and Hispanic women (7) are less likely to get annual breast screenings. Lack of insurance has been associated with significantly worse outcomes for several other cancer sites, specifically breast cancer (8). Moreover, malignant neoplasms exceed heart disease as a cause of death for Hispanics and the burden of cancer is more prominent in counties with larger numbers of Hispanics such as those in RHP 3 (9). The insurance barrier impacts indigent/low income women disproportionately. This population has a higher rate of non-compliance with recommended mammography screening. Overall, lower income, lack of

insurance and Hispanic ethnicity have been identified as factors associated with decreased participation in routine cancer screening.

Because this a mobile mammography program that offers screening at low or no cost to participants the barriers based on cost of services and lack of transportation to screening locations are eliminated. Furthermore, the project will addresses health care disparities due to language and cultural barriers because services and educational materials will be provided in Spanish using a culturally-tailored program for those in need of this approach.

Project Components:

Through Project VALET's Expansion Program, we propose to meet all required project components listed below and believe that the selected milestones and metrics relate to project components.

a) So that patients have enhanced access to breast cancer screening services, this project will expand the use of a mobile mammography screening program to additional clinics and counties in RHP 3. ~~Implement/expand a mobile health clinic program~~. ~~(P-3)~~ Implement evidence-based innovational project for target population (Expand Project VALET mobile mammography program) (P-2)
b) Designate/hire personnel or teams to support and/or manage the project. (P-X)
c) Develop process steps and marketing materials for the project. (P-X)
d) Conduct bi-annual trainings with clinic staff and make necessary technical upgrades to ensure compliance with patient reporting; market project through community outreach. (P-X)
e) Increase access to breast cancer screening through Project VALET. (P-X)
f) Participate in face-to-face learning (i.e., meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to "raise the floor" for performance). Each participating provider should publicly commit to implementing these improvements. (P-X)
g) Hire an evaluator to assess the project. Review program project implementation with collaborators and address issues that have arisen. Tailor and redesign the project to increase participant rates using feedback from the clinics and the evaluator.

Milestones & Metrics:

The following milestones and metrics have been chosen for the Expansion of Project VALET based on the core components and the needs of the target population:

- Process Milestone and Metrics: P-2 (P-2.1); ~~P-3 (P-3.1);~~ P-X (P-X.1);
- Improvement Milestones and Metrics: I-X (I-X.1, I-X.2) ~~I-12 (I-12.1), (I-12.2); I-15 (I-15.3)~~

Customizable Process Milestones and Metrics were chosen to specifically tailor their intent to the project process.

Unique community needs identification number the project addresses:

The project addresses the following unique community needs as identified in the community needs assessment:

- CN.2 – Inadequate access to specialty care

- CN.11 – High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with cancer
- CN.20 – Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs
- CN.21 – Inadequate transportation options for individuals in rural areas and for indigent/low-income populations
- CN.22 – Insufficient access to services that are specifically designed to address racial, ethnic and cultural health care disparities

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative: The expansion of Project VALET represents a significant enhancement of current breast cancer screening programs by further reducing barriers to care such as access to screening services at low or no cost, language barriers, and lack of transportation.

Related Category 3 Outcome Measure(s):

OD-11 Addressing Health Disparities in Minority Populations

IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (Standalone measure)

- Number of women that are assessed for eligibility for a screening mammogram, during the clinic intake. (TBD)
- Number of women who have been seen in the participating clinics who receive a well-woman exam

OD-12 Primary Care and Primary Prevention

IT-12.1 Breast Cancer Screening (HEDIS 2012)

- Number of women, ages 40 to 70, who have received an annual mammogram during the reporting period. (TBD)
- Number of women ages 40 to 70 in area, who meet Project VALET's eligibility criteria

Reasons/Rationale for selecting the outcome measure(s):

Providing free screening mammograms to uninsured and Medicaid women, who meet the screening criteria is a prevention strategy which removes the financial and transportation barriers that typically prevent these women from getting screened.

Screening for cancer implies testing for early stages of disease before symptoms occur. It involves application of an early detection test to a large number of apparently healthy people to identify those having unrecognized cancer. People with positive screening tests are subsequently investigated with diagnostic test(s) and those with confirmed disease are offered appropriate treatment and follow-up. The objective of screening is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after the symptoms occur. It is important to evaluate the efficacy of a given screening approach to reduce disease burden, harm, and cost, as well as its overall cost-effectiveness, before it is considered for widespread implementation in large population settings. The only justification for a screening program is early diagnosis that leads to a cost-effective and significant reduction in disease burden.

Screening completion rates for low-income/indigent and minority women in RHP 3 continue to fall below guidelines of the CDC initiative *Healthy People 2020* of 81.1 percent (10).

According to 2010 Texas Behavioral Risk Factor Surveillance System for PHR6/5S (which includes all the counties in RHP 3 except for Calhoun), 74.9% of Black women, 72.5% of Hispanic women, and only 69.3% of white women ages 40 and over have had a mammogram within the past two years (11). For women in household earning less than $25,000 per year, 64.3% have had a mammogram within the past two years. *Healthy People 2020*'s target for the breast cancer death rate is 20.6 deaths per 100,000 females and it seeks to reduce late-stage diagnosis of breast cancer to 41.0 new cases per 100,000 females by 2020 (12). None of the counties in RHP 3 has met this goal with the exception of Fort Bend County with 20.1 deaths per 100,000 for 2005-2009 (13).

Relationship to other Projects:
The project will support Goal 5, "Reducing the mortality of breast cancer in the Houston MSA," one of the eight goals of the Comprehensive Cancer Control Program at The University of Texas MD Anderson Cancer Center.

Relationship to Other Performing Providers' Projects in the RHP:
The increase of primary care and specialty care will naturally result in additional ambulatory care encounters for our region patient base. The ambulatory initiatives cover items such as laboratory, PT/OT, social work, etc. and are a necessity of our patients to ensure a comprehensive treatment for access as well as cost avoidance. The Region 3 initiative grid in the addendum reflects all ambulatory operations initiatives.

Plan for Learning Collaborative:
We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for the Region 3, Harris Health System. Our participation in this collaborative with other performing providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our region's health care system.

Project Valuation: We have based our project valuation on California's 1115 Medicaid Waiver model. As such, we have valued our projects at 2.5 times that of the estimated costs. Basing our valuations on California's calculations we know we are well within the potential range of future cost savings when looking at the following from Prevention Institute and Trust for America's Health Issue Report entitled *Prevention for a Healthier America: Investments in Disease Prevention Yield Significant Savings, Stronger Communities (July 2008)*:

- Prevention can reduce end-of-life costs by increasing health during the lifespan, what researchers call the *compression of morbidity*.
- There is a substantial return-on-investment in prevention – For every $1 invested in community-based prevention, the return amounts to $5.60.

Pass 2

Project Option 2.7.2 – Implement innovative evidence-based strategies to reduce tobacco use – Replicating Ask Advise Connect (AAC) in Federally-Qualified Health Centers
Unique RHP Project ID: 112672402.2.5
Performing Provider Name/TPI: The University of Texas MD Anderson Cancer Center / 112672402
Project Summary:
Provider: The University of Texas MD Anderson Cancer Center is a comprehensive cancer center ranked first in cancer care by *U.S. News & World Report* and dedicated to patient care, education, research and prevention. MD Anderson is comprised of several Texas Medical Center campus locations, two research campuses in Bastrop County, Texas, four regional care centers and a number of national and international divisions and affiliates. More than 108,000 people—almost one-third of them new patients—were seen in FY2011. MD Anderson provided $215 million in uncompensated charity care to Texans in FY2011.
Intervention(s): Ask Advise Connect (AAC) will be delivered in Federally Qualified Health Centers (FQHCs) in Harris County by implementing clinical practice guidelines and promoting health system supports in electronic health records. In AAC, licensed vocational nurses and medical assistants are trained to ask all adult patients at every visit about their smoking status at the time that vital signs are assessed, provide brief advice to all smokers to quit, offer cessation assistance via the Quitline, and directly connect patients willing to accept assistance with the Quitline. Connections to the Quitline are made by clicking an automated link in the electronic health record (EHR) that sends smokers' names and phone numbers to the Quitline within 24 hours. Patients are contacted by the Quitline within 48 hours of receipt of their contact information.
Need for the project: **A)** This project addresses Community Needs in RHP3: CN.11-High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease including: cancer, diabetes, obesity, cardiovascular disease, asthma, and AIDS/HIV; CN.12 – High rates of tobacco use and excessive alcohol use. **B)** An important component of the Patient Protection and Affordable Care Act (i.e., health care reform; ACA) is that information regarding tobacco use assessment and treatment be systematically tracked and recorded through electronic health records (EHR). Meaningful use criteria require clinicians to screen the smoking status of more than 50% of all unique patients who are 13 years old or older. Additionally, the percentage of patients 18 and older who are current tobacco users and who receive advice, cessation treatments, or recommendations to use cessation medications and/or other strategies from a practitioner during the year, must also be tracked.
Target Population: Adult tobacco users within the nine FQHCs in Harris County. This represents a total of 25 primary care clinic sites. FQHCs provide care to approximately 80,160 medically-underserved individuals in the greater Houston area.
Category 1 or 2 expected patient benefits: The DY3 & 4 goals are to screen 75% of the adult patients receiving services at selected FQHCs and to connect 15% of eligible smokers to the Quitline.
Category 3 outcomes: **IT-11.1** Improvement in clinical indicator in disparity population (Smoking Cessation – Staying Quit) – DY4, 28% of smokers enrolled in Quitline treatment will be abstinent at the time of follow-up; **IT-11.6** Other Outcome Improvement Target (Smoking Cessation – Quit Attempts) – DY 4, 50% of smokers enrolled in Quitline treatment will make a quit attempt

Project Option 2.7.2 Implement innovative evidence-based strategies to reduce tobacco use – Replicating Ask Advise Connect in Federally-Qualified Health Centers

Unique RHP Project Identification Number: 112672402.2.5 / Pass 2
Performing Provider Name/TPI: The University of Texas MD Anderson Cancer Center / 112672402
Project Description: Smoking is the leading cause of preventable disease, disability, and death in the United States. Smoking cessation decreases the risk of lung cancer, other cancers, heart attack, stroke, and chronic lung disease.[1] Although the health benefits of quitting smoking are substantial, quit rates are low. Furthermore, smokers with lower socioeconomic status tend to be less successful at quitting. Therefore, connecting underserved smokers with evidence-based cessation treatment such as treatment delivered by Quitlines is crucial for disease prevention and the elimination of tobacco-related health disparities.

The overarching goal of the proposed project, Replicating Ask Advise Connect (AAC), is to deliver evidence-based smoking cessation treatment to smokers seeking care in Federally-Qualified Health Centers (FQHC) in Harris County, Texas, and to ultimately reduce tobacco-related morbidity and mortality, particularly among individuals who are disproportionately burdened with the disease.

Associations Between Socioeconomic Status and Smoking. Smoking is becoming increasingly concentrated among individuals with the lowest levels of education, income, and occupational status.[2-5] These smokers tend to have greater difficulty quitting. [6,7] Further, low SES smokers are less likely to use effective resources for quitting and this phenomenon may partially explain why these smokers are less successful at quitting.[8] Smoking is the single largest behavioral contributor to cancer and other diseases, and heavily accounts for a significant proportion of socioeconomic disparities in the incidence and mortality of cancer and other diseases.[9,10] Thus, it is crucial that these smokers be provided with effective and accessible treatment.
Program overview . AAC is delivered through implementing clinical practice guidelines and promoting health system supports in electronic health records. In AAC, licensed vocational nurses and medical assistants are trained to ask all adult patients at every visit about their smoking status at the time that vital signs are assessed, provide brief advice to all smokers to quit, offer cessation assistance via the Quitline, and directly connect patients willing to accept assistance with the Quitline. Connections to the Quitline are made by clicking an automated link in the electronic health record (EHR) that sends smokers' names and phone numbers to the Quitline within 24 hours. Patients are contacted by the Quitline within 48 hours of receipt of their contact information.

Quitline-Delivered Treatment. The Quitline is supported by the State of Texas Department of State Health Services and operated by Alere Wellbeing, Inc. It is staffed with trained cessation counselors available 24 hours a day, seven days a week. Counseling is available in English and Spanish, and can be provided in at least 15 additional languages through a third party. All smokers who enroll in cessation treatment receive the standard *Guideline*-based protocol along with access to nicotine replacement therapy. [11,12] This includes up to five proactive counseling calls, each designed to help develop problem-solving and coping skills, secure social support, and plan for long-term abstinence. Follow up calls are timed to address smoking relapse. The call timing is flexible and adjusted as needed.

Community Partners. For this project, we will partner with the Harris County Healthcare Alliance (the Alliance), which coordinates efforts of safety-net clinics in Harris County. The Alliance will coordinate communication, EHR support, and data collection with participating FQHCs. There are nine Federally Qualified Health Centers in Harris County, with a total of 25 primary care clinic sites. FQHCs provide care to approximately 80,160 medically-underserved individuals in the greater Houston area.

The proposed program builds upon a strong and established partnership with Harris Health, The Texas Quitline, and Alere Wellbeing, and all partners will play substantial and integral roles in the program. Currently, AAC is being implemented in one FQHC, Good Neighbor Healthcare Center. Replication of the project to additional FQHCs will allow us to dramatically increase the number of smokers that are connected with evidence-based cessation treatment through implementing systems-level changes that will address both clinic- and patient-level barriers to connection with treatment through the use of an automated connection system. El Centro de Corazon is the first clinic that has agreed to implement AAC through the expansion effort.
Goal(s) and Relationship to Regional Goals(s): Aim 1: Disseminate a previously developed, evidence-based approach to linking smokers with cessation treatment in Federally-Qualified Health Centers.

Our goal is to work with up to four Federally Qualified Health Centers to disseminate Ask Advise Connect, a tested tobacco treatment program that utilizes systems level change and EHR to connect smokers to tobacco cessation treatment. If successful, our program will be readily implemented, maintained, and administered by the clinic sites and ultimately, disseminable to centers across the RHP.

Aim 2: Implement an evidence-based approach to linking smokers with cessation treatment among underserved persons receiving care at Federally-Qualified Health Centers.

Our goal is to screen, enroll, and connect smokers to smoking cessation treatment (standard Guideline-based treatment provided by the State Quitline) to smokers receiving care at FQHCs.

Aim 3: Evaluate the effectiveness of the smoking cessation treatment connection program implemented at FQHCs.

Our goal is to evaluate the following:

- ***Reach** of the program - defined as the proportion of smokers who enroll in smoking cessation treatment through the program.*
- ***Efficacy** of the program - defined as the proportion of smokers who successfully quit smoking, assessed at 6 month follow-up.*
- ***Implementation** of the program – defined as: 1) proportion of patients screened for program eligibility; 2) proportion of patients contacted by Quitline; 3) proportion of patients enrolled in treatment, and 4) proportion of patients who successfully quit smoking.*

Regional Goal. This proposed project is responsive to the first regional goal, "Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health outcomes and patient satisfaction." At the present time, most FQHCs providing care to the underserved population in the greater Houston area do not systematically screen smoking status

or record status in the EHR. However, smoking status and tobacco cessation are new healthcare clinical measures that will be required for FQHCs to collect. Thus, the proposed project will fill an important gap by providing a systematic way to assess all patients' smoking status, provide advice to quit, and connect patients to tobacco cessation treatment.

Challenges: Major challenges of the project include the following: 1) enrolling FQHCs to accept the intervention, 2) overcoming barriers to implement the intervention, and 3) offering a sustainable program. We have carefully considered each of these challenges in the design of the project. First, buy-in will be facilitated by our partnerships with the Alliance and with Good Neighbor Health Care Center. Specifically, the executive director at Good Neighbor, strongly supports this program and is committed to disseminating Ask Advise Connect to other FQHCs. Also, key collaborators at the Alliance will coordinate communication, data collection, and systems (EHR) improvements with FQHCs. Second, the approach itself has been tested in 10 Harris Health community clinics, 10 Kelsey Seybold Clinics, and one FQHC and can be tailored to the EHR systems and staffing plans of each clinic. The clinical staff provided critical input to the planning and implementation of the program. The program is intended to work within the existing vital signs and patient assessment procedures of each clinic and adds minimal time to existing practices. Also, MD Anderson program staff will provide on-site training and technical support needed to implement the intervention. Third, a crucial component of the project is the training of LVNs and medical assistants to screen for smoking status, provide advice to quit, connect patients to treatment, and log process in the EHR. This intervention provides a clinical systems change to consistently screen for smoking status and connect smokers to cessation treatment. The personnel resources and EHR changes will remain after the funding for the program ends. The program will ultimately meet the needs of the clinics to address tobacco cessation, a new healthcare clinical measure requirement of FQHCs.

Five Year Expected Outcome for Provider and Patients: We believe our program will: 1) enhance screening for smoking, 2) promote the delivery of evidence-based smoking cessation treatment, 3) reduce the prevalence of current smoking, and ultimately 4) reduce morbidity and mortality of smoking-related malignancies among FQHC patients.

Starting Point/Baseline: Patients will be recruited from the population of individuals receiving care at up to four Federally Qualified Health Centers. The first clinic to agree to disseminate AAC is El Centro de Corazon. El Centro provides care to approximately 5,000 adult patients per year. The patient population is predominantly Hispanic (94%). Currently, smoking status is not systematically assessed, nor is cessation treatment offered.

El Centro: Based on our group randomized trial conducted in 10 Harris Health Community Health Centers, 16.2% of patients (810) are expected to be current smokers. Although our goal is to have the smoking status of all patients seeking care at the clinics assessed and recorded in the EHR, we believe that it is more realistic to estimate that 75% of patients will have their smoking status assessed and recorded in the EHR. Therefore, we anticipate that 3,750 patients will have their smoking status assessed and recorded in the EHR and that 607 (16.2%) of these individuals will be current smokers. All smokers will receive advice to quit smoking and will be offered connection with the Texas Quitline.

Based on the results of our previous studies, it is anticipated that 12.8% of the 607 patients identified and documented in the EHR as current smokers (77) will enroll in Quitline-delivered

treatment. Based on data from the Quitline, 85% of individuals who enroll in treatment will complete their first counseling call (65). Therefore, we anticipate that 65 smokers at El Centro will receive treatment annually.

The Alliance will work with us to identify and coordinate dissemination of AAC in up to three additional FQHCs of similar size. Therefore, reach will be multiplied based on number of clinics replicating AAC. With four clinics enrolled, we anticipate connecting 250 smokers to treatment.

Rationale: Reasons for selection the project option: The Role of Healthcare Reform in Supporting the Sustainability of AAC. Recent policy initiatives have created a unique and historic opportunity to integrate and sustain the delivery of evidence-based tobacco treatments into healthcare settings. Specifically, the Patient Protection and Affordable Care Act (i.e., health care reform; ACA) has created payment incentives that address tobacco. A critically important component of this legislation is that information regarding tobacco use assessment and treatment be systematically tracked and recorded through electronic health records (EHR). Meaningful use criteria require clinicians to screen the smoking status of more than 50% of all unique patients who are 13 years old or older, as well as track the percentage of patients 18 and older who are current tobacco users, seen by a practitioner during the year, and receive advice, cessation treatments, or recommendations to use cessation medications and/or other strategies.[13] As healthcare systems in Texas begin to implement systems to comply with meaningful use criteria regarding tobacco, referrals to the Texas Quitline are likely to increase dramatically. Unfortunately, without adequate infrastructure and financial support to treat these additional smokers, the Quitline is likely to become quickly overwhelmed and be unable to meet this increased demand for services.

Enhancing Widespread Adoption of Evidence-Based Smoking Cessation Treatment Delivered via the Texas Quitline. The past three decades have generated a tremendous amount of research and knowledge regarding how best to help smokers quit. These data indicate that the use of evidence-based cessation treatments can increase smoking abstinence rates as much as fourfold [14]. However, far more attention and research dollars have been directed toward expansion of this knowledge base than to the dissemination and utilization of this knowledge. This lack of dissemination will ultimately diminish progress toward achieving critically important public health goals [15,16]. Thus, the focus of this proposal is on increasing utilization of the Texas Quitline among smokers with the greatest need for assistance. Ask, Advise, Refer (AAR) is the recommended standard of care for linking smokers in healthcare settings with evidence-based cessation treatment. **Although AAR is an improvement over previous strategies, we have developed, implemented, and maintained an even more effective strategy for providing a seamless linkage between health care systems and the Texas Quitline. Ask Advise Connect (AAC) utilizes the electronic health record (EHR) to systematically prompt clinicians to assess the smoking status of every patient at every visit, advise him/her to quit smoking, and directly and electronically link interested smokers with the Quitline.** In a recently completed group randomized controlled trial among 10 Harris Health System community health clinics and over 113,000 patients, Quitline treatment uptake is 0.5% of all smokers seeking care at AAR clinics, vs. 14.7% among patients seeking care at AAC clinics, a 30-fold difference. To the best of our knowledge, this is the highest population level cessation treatment uptake reported to date. Similarly impressive results (0.6% in AAR clinics vs. 7.8% in AAC clinics)

were found in a second recently completed group randomized controlled trial among 10 Kelsey Seybold clinics (a Houston based health care system that does not focus on the underserved).

Project Components: We believe our program will result in: 1) dissemination of an evidence-based smoking cessation program [P-X], 2) enhanced screening for smoking [P-X], 3) promote the delivery of evidence-based smoking cessation treatment [P-2], 4) reduce the prevalence of current smoking [IT-11.1], and ultimately 5) reduce morbidity and mortality of smoking-related malignancies in the FQHC patient population [IT-11.6].

Milestones and Metrics: The following milestones and metrics have been chosen for the Smoking Cessation Program for Underserved Persons receiving care at FQHCs:

- Process Milestones and Metrics: P-X (P-X.1, P-X.2); P-2 (P-2.1, P-2.2); P-7 (P-7.1, P-7.2)
- Improvement Milestones and Metrics: I-X (I-X.1, I-X.2); OD-11 (IT-11.1, IT-11.6)

Unique community need identification number the project addresses: The project addresses the following unique community needs as identified in the community needs assessment:

- CN.11 – High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease including: cancer, diabetes, obesity, cardiovascular disease, asthma, and AIDS/HIV
- CN.12 – High rates of tobacco use and excessive alcohol use

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

MD Anderson tested AAC in 10 Harris Health System community health centers, 10 Kelsey Seybold clinics, and is currently implementing the program in Good Neighbor Healthcare Center. AAC was found to have from a 13- (Kelsey) to 30-fold (Harris Health) increase in smoking cessation treatment enrollment compared to AAR, the standard treatment. To the best of our knowledge, this is the highest population level cessation treatment uptake reported to date. This new initiative is to support widespread adoption of AAC to Federally-Qualified Health Centers, where it will have broad reach to medically-underserved smokers.

<u>Related Category 3 Outcome Measure(s):</u>

IT-11.1 Improvement in clinical indicator in disparity population (Smoking Cessation – Staying Quit)

- DY 4, 28% of smokers enrolled in Quitline treatment will be abstinent at the time of follow-up

IT-11.6 Other Outcome Improvement Target (Smoking Cessation – Quit Attempts)

- DY 4, 50% of smokers enrolled in Quitline treatment will make a quit attempt

Reasons/rationale for selecting the outcome measure(s): The selected Category 3 Outcome Measure directly addresses the Regional Health Plan Community Needs CN.12 – High rates of tobacco use, and would capture reduction in tobacco use among smokers in participating FQHCs. Aim 3 of the program is to evaluate the effectiveness of the smoking cessation program implemented at FQHCs. The reach, efficacy, and impact of AAC will be evaluated using the RE-AIM conceptual framework.[17] RE-AIM provides a systematic way to evaluate the impact of

the dissemination and implementation of public health interventions and includes five criteria: reach, efficacy, adoption, implementation, and maintenance. **Reach** is defined as the number of smokers visiting the clinics that talked with the Quitline / total number of smokers that visited the clinics. **Efficacy** is defined as the total number of smokers visiting the clinics that enrolled in treatment with the Quitline / total number of smokers visiting the clinics that talked with the Quitline. **Impact** is defined as Reach x Efficacy.

Replication. A major consideration that guided the conceptualization and development of the Ask Advise Connect model was that it has the potential to make a significant public health impact. Because we are delivering the approach in community clinics that provide care to underserved, primarily racial/ethnic minority patients with low socioeconomic status, our dissemination setting is representative of real-world population-based tobacco control settings and has broad reach. In addition, the dissemination approach is intended to be delivered by clinical providers using the EHR. Third, the approach has been designed to greatly streamline the process of connecting smokers interested in quitting with the Quitline in order to shift the burden of counseling from clinical providers to the Quitline. In contrast to providing counseling in the clinic setting, connecting smokers with proactive telephone counseling via the Quitline is convenient, eliminates transportation time and costs, entails no childcare costs, is more acceptable to patients than face-to-face counseling, reduces the burden on physicians and other members of the health care team, and has demonstrated strong efficacy [11,18-22]. Importantly, our approach could be feasibly and cost-effectively implemented in numerous population-based settings for tobacco control (e.g., clinics, hospitals, dentist offices), the environments where quitlines would be most likely to be disseminated and implemented. Taken together, each of these factors is important and all are intended to ensure that the dissemination approach could be easily adopted in other public health settings.

Relationship to other Projects: By delivering an evidenced based smoking cessation program to the underserved population of smokers in FQHCs, this program is in line with the RHP. Unique RHP Project ID Number 112672402.2.2 provides a similar smoking cessation project in one FQHC, tailored to persons living with HIV/AIDS. Unique RHP Project ID Number 112672402.1.1 Expand Mobile Clinics will work in partnership with FQHCs to provide mammography screening. Also, all RHP project teams work in collaboration with the Comprehensive Cancer Control Program at MD Anderson.

Relationship to Other Performing Providers' Projects in the RHP: Innovation is key to the transformation of healthcare in our community. The consistency of innovation in our region allows for increased improvements based on research trends, patient need, and provider availability. The waiver funding allows for innovation in specific areas and all innovative projects included in the plan are similar in the fact of program redesigns for historic treatments, and focus to chronic condition outcome measures such as central line infections. The Region 3 initiative grid in the addendum can provide a side by side comparison of all projects that directly relate to innovation.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for RHP3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation: We have based our project valuation on California's 1115 Medicaid Waiver model. As such, we have valued our projects at 2.5 times that of the estimated costs. Basing our valuations on California's calculations we know we are well within the potential range of future cost savings when looking at the following from Prevention Institute and Trust for America's Health Issue Report entitled *Prevention for a Healthier America: Investments in Disease Prevention Yield Significant Savings, Stronger Communities (July 2008)*:

- Prevention saves money – an investment of $10 per person per year in programs to increase physical activity, improve nutrition, and prevent tobacco use could save the country more than $16 billion in annual health care costs within five years.
- Prevention can reduce end-of-life costs by increasing health during the lifespan, what researchers call the *compression of morbidity*.

There is a substantial return-on-investment in prevention – For every $1 invested in community-based prevention, the return amounts to $5.60.

West Houston Medical Center

Pass 1

Project Option-2.9.1 Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care: Expand Senior Care Capacity at West Houston

Unique RHP Project Identification Number: 094187402.2.1

Performing Provider Name/TPI: HCA - West Houston Medical Center TPI/094187402

- Provider: West Houston Medical Center is a 276-bed facility in Houston, Texas. The facility is located in the Houston-Sugarland-Baytown MSA, which serves a population of approximately 6,000,000 people.
- Intervention(s): HCA intends to improve the patient throughput, overall experience and quality of care for geriatric patients. Specifically, HCA will create a designated "Senior Care Entrance" at the hospital and assign special hospital beds to accommodate the geriatric population. Additionally, HCA will train and maintain a Senior Care Coordinator dedicated to overseeing protocol-driven geriatric care. The Senior Care Coordinator will assist seniors in managing their appointments, maintaining their individual healthcare regimens, and accessing available support through the hospital and the community.
- Need for the project: Geriatric patient populations face unique challenges in obtaining care, and those challenges must be addressed in order for geriatric patients to have effective access to care. Harris County Hospital District's DSRIP work groups have identified expanding access to care for seniors as a priority for the region. These patients are often on a fixed income, may have increased problems with mobility, memory, and technological savvy which inhibit their ability to effectively access care.
- Target population: The target population of this project is geriatric patients in the community and surrounding areas, particularly those patients who are currently unable to access to care effectively. West Houston Medical Center experiences approximately 15,000-16,000 patient encounters with geriatric patients per year (with geriatric defined as $\geq$ 65 years or older). Of the geriatric patients treated, 20-26% are Medicaid-eligible or uninsured. Thus, while this project will benefit all geriatric patients at the hospital, 20-26% of the benefit will affect Medicaid and uninsured geriatric patients.
- Category 1 or 2 expected patient benefits: HCA will improve geriatric patients' experience at its facility, and improve short- and long-term patient outcomes, by assisting these patients in navigating the often fractured and confusing healthcare continuum. HCA will accomplish a four percent (4%) reduction in ED visits by patients enrolled in the navigator program in DY4, and a seven percent (7%) reduction by the end of DY5, as a result of increased preventative and managed care prior to seniors' conditions reaching an acute or emergent stage.
- Category 3 outcomes: IT 3.1 – Through this project, Bayshore will reduce the number of Potentially Preventable Readmissions (PPRs) for geriatric patients, indicating improved health outcomes and patient quality of life. PPRs are disruptive and often have a substantial impact on a patient's chance of long-term recovery, and PPRs add hefty additional costs to the healthcare delivery system that can be prevented through improved access to primary and preventative care.

DRAFT

Project Option-2.9.1 Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care: Expand Senior Care Capacity at West Houston

Unique RHP Project Identification Number: 094187402.2.1
Performing Provider Name/TPI: HCA - West Houston Medical Center TPI/094187402

Project Description:
Through implementing this project, HCA intends to improve the patient throughput, overall experience and quality of care for geriatric patients. Geriatric patients will benefit from the dedicated care designed to meet the needs of patients greater than 65 years of age who live in West Houston's primary and secondary zip codes (77072, 77082, 77083, 77036, 77042, 77077, 77094, 77099, 77450) located in Harris County. This dedicated care includes unique components to address both environmental and clinical service needs. Specifically, HCA will create a designated "Senior Care Entrance" at the hospital and assign special hospital beds which are designed to accommodate the geriatric population. Additionally, HCA will train and maintain a Senior Care Coordinator dedicated to overseeing protocol-driven geriatric care, which will be developed with input from facility geriatricians, and close communication with local SNFs, LTACs, and nursing homes to assure solid continuity of care. The Senior Care Coordinator will assist seniors in managing their appointments, maintaining their individual healthcare regimens, and accessing available support through the hospital and the community.

Goal(s) and relationship to Regional goal(s):
Project goals:
HCA hopes to improve geriatric patients' experience as inpatients and outpatients at its facility, and to improve short- and long-term patient outcomes by assisting these patients in navigating the often fractured and confusing healthcare continuum. Specifically, by enabling geriatric patients to access the care they need, which is tailored to their needs.

This project meets the following Region 3 goals:
While the Region has many specific objectives and improvement targets based on stakeholder input and community needs assessments, the over-arching goals that have guided many of our decisions include the following:

- Develop a regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire region, and improves health care outcomes and patient satisfaction.
- Increase access to primary and specialty care services, with a focus on underserved populations, to ensure patients receive the most appropriate care for their condition, regardless of where they live or their ability to pay.
- Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system, and
- Develop a culture of ongoing transformation and innovation that maximizes the use of technology and best-practices, facilitates regional collaboration and sharing, and engages

patients, providers, and other stakeholders in the planning, implementation, and evaluation processes.

Challenges and how addressed:

- Identifying a qualified Senior Care Coordinator and training that person in geriatric-specific care needs and protocols – HCA will recruit and retain an individual who is qualified to navigate the healthcare continuum and will provide training for geriatric specific services.

- Need for community and provider education regarding the dedicated Senior Care services and geriatric protocols– HCA will address this challenge by training the Senior Care Coordinator to work with providers inside and outside of the hospital and prove the efficacy of managing seniors' health on a consistent basis, as opposed to providing episodic care with little to no support.

- Educating patients and encouraging participation in the program – HCA will address this challenge by having the Senior Care Coordinator and other providers within the hospital explain the program to patients prior to enrollment.

5-year expected outcome for provider and patients:
HCA hopes to accomplish a seven percent (7%) reduction in ED visits by patients enrolled in the navigator program by the end of the Waiver, as a result of increased preventative and managed care prior to seniors' conditions reaching an acute or emergent stage.

Starting Point/Baseline:
West Houston Medical Center does not currently provide patient navigation services to its geriatric patients. The hospital will establish a baseline of the number of geriatric patients visiting the ED in DY2, in order to measure progress going forward.

Rationale:
Geriatric patient populations face unique challenges in obtaining care, and those challenges must be addressed in order for geriatric patients to have effective access to care. Harris County Hospital District's DSRIP work groups have identified expanding access to care for seniors as a priority for the region (see "DSRIP Initiative Prioritization/Ranking," item 71).

Patient navigators assist patients and their families in navigating the fragmented maze of doctors' offices, clinics, hospitals, out-patient centers, payment systems, support organizations and other components of the healthcare system. Services provided by patient navigators vary by program and the needs of the patient, but often include:[257]

- Facilitating communication among patients, family members, survivors and healthcare providers.
- Coordinating care among providers.
- Arranging financial support and assisting with paperwork.
- Arranging transportation.

DRAFT

- Ensuring that appropriate medical records are available at medical appointments.
- Facilitating follow-up appointments.
- Community outreach and building partnership with local agencies and groups.
- Ensuring access to clinical trials.

Access to the above services is especially imperative for senior patients, as they are often on a fixed income, may have increased problems with mobility, memory, and technological savvy. The Senior Care Coordinator can assist seniors in confronting the challenges associated with access necessary healthcare, in order to prevent the deterioration of otherwise manageable conditions and to improve the quality of life for seniors.

Project Components:
HCA will address the project components as follows:

a. Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency. HCA has identified geriatric patients as a patient population with high rates of ED users. The Senior Care Coordinator will target inpatient seniors for education and intervention aimed at preventing future ED use for non-emergent conditions and/or preventing conditions from becoming emergent in the first place.

b. Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators. HCA will recruit and retain a qualified health worker to be the Senior Care Coordinator, with special consideration for candidates who have experience working with the senior community.

c. Connect patients to primary and preventive care. The Senior Care Coordinator's main function will be to assist seniors in making primary and preventative care appointments, determining the assistance necessary to help seniors keep those appointments, and to work with seniors and their families to assure that their access to support (financial, transportation, in-home care, etc) is adequate.

d. Increase access to care management and/or chronic care management, including education in chronic disease self-management. Currently, senior patients at the hospital do not have access to a dedicated care coordinator to assist in self-management education and chronic care management. The Senior Care Coordinator will be dedicated to providing those services.

e. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying "lessons learned," opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. As part of Milestone 3, HCA will participate in learning collaboratives with other

DRAFT

Performing Providers engaging in Care Navigation to share lessons learned, identify best practices, and discuss key challenges.

Unique community need identification number the project addresses:

- CN.1 - Inadequate access to primary care
- CN.6- Inadequate access to treatment and services designed for special needs populations, including disabled, homeless, children, elderly
- CN.7- Insufficient access to care coordination practice management and integrated care treatment programs
- CN.8- High rates of inappropriate emergency department utilization
- CN.9- High rates of preventable hospital readmissions
- CN.10- High rates of preventable hospital admissions
- CN.11-High rates of chronic disease and inadequate access to treatment programs and services for illnesses associated with chronic disease, including: Cancer, Diabetes, Obesity, Cardiovascular disease, Asthma, AIDS/HIV
- CN. 20- Lack of access to programs providing health promotion education, training and support, including screenings, nutrition counseling, patient education programs
- CN.23- Lack of patient navigation, patient and family education and information programs
-

How the project represents a new initiative for the Performing Provider or significantly enhances an existing delivery system reform initiative:

Currently, West Houston Medical Center does not provide patient navigation services for the senior population, thus this project is a brand-new initiative for this hospital.

Related Category 3 Outcome Measures: OD-3 Potentially Preventable Re-Admissions; IT 3.1 All cause 30 day readmission rate – NQF 1789 (for patients enrolled in care navigation services).

Reasons/rationale for selecting the outcome measure(s):
HCA chose this Category 3 Outcome because one of the important goals behind implementing the Senior Care Coordination program is to reduce the number of PPRs, which should be indicative of improved health outcomes and patient quality of life. PPRs are disruptive and often have a substantial impact on a patient's chance of long-term recovery, and PPRs add hefty additional costs to the healthcare delivery system that should be preventable through improved access to primary and preventative care.

Relationship to Other Projects: This project is part of HCA's larger plan of expanding and developing specialty services along with delivery improvements targeted to particular populations (e.g., OB/GYN patients and behavioral health patients), while improving access to care.

Relationship to Other Performing Providers' Projects in the RHP: The increased access to primary care visits will naturally generate additional need of specialty care visits based on the condition and acuity of the patients served. Understanding that the patient base targeted through this initiative will generate significant specialty care visits due to chronic conditions and lack of

DRAFT

previous treatments, this initiative and similar initiatives will focus to 30-day readmission rate reductions, improvement for patient satisfaction scores, and admission rates specific to chronic conditions. Numerous initiatives have been included in the RHP plan and the addendum of the Initiative Grid can directly tie all specialty care projects together by category.

Plan for Learning Collaborative: We plan to participate in a region-wide learning collaborative(s) as offered by the Anchor entity for Region 3, Harris Health System. Our participation in this collaborative with other Performing Providers within the region that have similar projects will facilitate sharing of challenges and testing of new ideas and solutions to promote continuous improvement in our Region's healthcare system.

Project Valuation:

Approach for valuing project: The valuation of each HCA project takes into account the degree to which the project accomplishes the triple-aim of the Waiver: community needs, the population served by the project (both number of people and complexity of patient needs), and investment required to implement the project.

Rationale for project valuation: Specifically, the valuation of this project incorporates the need for improved access to care and quality of care among Region 3 geriatric patient populations, and the potential for sustainable improvement in this area as a result of implementing this project. The valuation also takes accounts for the emphasis that the Region 3 DSRIP work groups have placed on the expansion of access to care for seniors.

C. Category III

DRAFT

Baylor College of Medicine

Pass 1

DRAFT

Title of Outcome Measure (Improvement Target): IT-1.20 Other: Reduction of STI Rate among Adolescents and Young Adults

Unique RHP outcome identification number(s): 082006001.3.1
Performing Provider Name/TPI: Baylor College of Medicine/082006001

Outcome Measure Description:
Because this is a new clinic, process milestone P-2 was selected to establish the baseline to which improvement will be compared. Outcome improvement target IT-1.20 was selected; the measure will be reduction in STI (chlamydia, gonorrhea and syphilis) rates by 5% compared to the baseline in DY5.

Process Milestones:
- DY3: P-2
- DY2: P-1

Outcome Improvement Target(s):
- DY4: IT-1.20
- DY5: IT-1.20

Rationale:
Because the Baylor Teen Health Clinic (BTHC) focuses on prevention, the proposed Category 3 measure is reduced STI rate. The chronic illness milestones identified on the Category 3 do not address the salient health issues faced by adolescents and young adults. Because STIs disproportionately affect this population, the STI rate is a more appropriate metric that clearly measures the success of the STI counseling proposed in the Category 1 improvement measures. Because the goal is to reduce the rate among the population served by the BTHC, baseline data will be established during the first full year the clinic is operational (DY3). The mission of the BTHC is to provide access to affordable care for at-risk, underserved teens in the community. By reducing STI rates and associated sequelae the BTHC will help its young patients avoid long-term health effects associated with STIs.

Outcome Measure Valuation:
The value of this project was determined by an econometrics assessment of STI treatment. Researchers at the CDC have evaluated the cost effectiveness of STI treatment[258] and developed formulae to assess the direct and indirect cost savings of education, screening and treatment. The formula developed for HIV costs averted by HIV counseling and testing was used to calculate the estimated bundle amount for STI counseling, as HIV counseling is included in all STI education, and screening is available to all patients. The estimated bundle amount for STI treatment was based on the pro rata sequelae costs averted for the treatment of gonorrhea, which is a more conservative estimate than that for treatment of chlamydia or syphilis, and it is estimated that 90% of patients treated will be women. The value for decreases in STI rates is based on treatment and pro rata sequelae costs averted because of reductions in the infections in the population, assuming the reductions occur in a patient population of 1,000 patients, or 10 cases avoided per percentage point reduction.

DRAFT

Title of Outcome Measure (Improvement Target): IT-1.20 Other: Reduction of Pregnancy Rates among Adolescents and Young Adults

Unique RHP outcome identification number: 082006001.3.2
Performing Provider Name/TPI: Baylor College of Medicine/082006001

Outcome Measure Description:
Because this is a new clinic, process milestone P-2 was selected in order to establish the baseline to which we can compare outcomes. Outcome IT-1.20 was selected to measure reduction in pregnancy rates by 2% compared to the baseline in DY5.

Process Milestones:
- DY2: P-1
- DY3: P-2

Outcome Improvement Target(s):
- DY4: IT-1.20
- DY5: IT-1.20

Rationale:
Because the BTHC focuses on prevention, the proposed Category 3 measure is reduced pregnancy rates. Pregnancy reduction is an appropriate measure for this population. The milestones identified in Category 3 pertain to improvements in low birth weight, infant mortality, etc., which do not apply if pregnancy is avoided altogether. Decreasing teen pregnancies and births will indicate that the BTHC succeeds in providing access to family planning and contraception services. Because the goal is to reduce the rate among the population served by the BTHC, baseline data will be established during the first full year the clinic is operational (DY3). The mission of the BTHC is to provide access to affordable care for at-risk, underserved teens in the community. By reducing teen pregnancy, the BTHC will help its young patients become contributing members of society.

Based on our experience at other Baylor Teen Health Clinics, reducing pregnancy rates takes time as we make the existing population aware of available services. Moving into a new population or geographic area means that we must ramp up our communications efforts. In the first years, pregnant patients come to our clinics to take advantage of prenatal and parenting services. They then use our services to avoid a second unplanned pregnancy. It typically takes up to five years achieve a 5% reduction in pregnancy rates. The speed of reduction increases as the population becomes more aware of our services and takes advantage of them.

DRAFT

Outcome Measure Valuation:
The value of this project was determined by an econometrics assessment of teen pregnancy. The National Campaign determined that the average cost to taxpayers for teen births between 1991 and 2004 was $15.1 billion[259], or an average of $20,000 per birth. This cost includes medical expenses, welfare services and productivity loss. The costs averted are broken further into episodic costs of $5,000 for the cost of delivery and healthcare for mother and child the first year

[259] The National Campaign. By the Numbers: The Public Costs of Teen Childbearing in Texas, November 2006. http://www.thenationalcampaign.org/costs/pdf/states/texas/fact-sheet.pdf. Accessed October 1, 2012.

after birth. The remaining $15,000 is prorated for the life of the Waiver. Based on the average birth rate for Harris County, successful family planning will help us avoid an additional 63 births per 1,000 patients. Teen pregnancy rates in the neighborhoods currently serviced by the Teen Clinic are higher than the Harris County average. By reducing the pregnancy rate, we will achieve additional savings in healthcare costs and taxpayer burden that are not duplicated in the estimated bundle for the rendering of contraception management services.

DRAFT

Title of Outcome Measure (Improvement Target): IT-1.10 Improved HbA1c Control

Unique RHP outcome identification number(s): 082006001.3.3
Performing Provider Name/TPI: Baylor College of Medicine/082006001

Outcome Measure Description:

Because this is a new clinic, process milestone P-2 was selected in order to establish the baseline to which we can compare outcomes. Outcome IT-1.10 was selected to measure improvement in Diabetes care control by 15% in DY5 compared to the baseline.

Process Milestones:

- DY2: P-1
- DY3: P-2

Outcome Improvement Target(s):

- DY4 and DY5: IT-1.10 Improve Hb1Ac control showing increased improvement year over year

Rationale:

The Fifth Ward has been identified as a medically underserved area[260] and is predominantly comprised of residents who identify themselves as Black, Hispanic or Latino[261]. Improvements in HbA1c control can improve patient quality of life and cost of care by reducing the lifetime incidence of blindness, end-stage renal disease (ESRD) and coronary artery disease[262]. Black and Hispanic patients have higher rates of diabetes and higher mortality rates due to diabetes[263] than white patients. African Americans are more likely to develop ESRD. This measure will reflect the Fifth Ward Clinic's success in implementing continuous process improvements to improve patient outcomes.

Outcome Measure Valuation:

The value of weight reduction was calculated based on the percentage of the population that is obese[18] and not currently diagnosed with diabetes[20]. Of those patients, it is expected that a 5-7% reduction in weight will reduce the risk of diabetes by 58%[21]. The annual savings[21] was applied to the number of diabetes cases avoided due to weight management for the duration of the Waiver.

DRAFT

Title of Outcome Measure (Improvement Target): IT-1.20 Improved Weight Control

Unique RHP outcome identification number(s): 082006001.3.4
Performing Provider Name/TPI: Baylor College of Medicine/082006001

Outcome Measure Description:

Because this is a new clinic, process milestone P-2 was selected in order to establish the baseline population. Outcome IT-1.20 other outcome improvement target was selected to measure weight loss of at least 5% in 10% of the target population by DY5.

Process Milestones:

- DY2: P-1
- DY3: P-2

Outcome Improvement Target(s) for each year:

- DY4 and DY5: IT-1.20 Improve weight control showing increased improvement year over year

Rationale:

The Fifth Ward has been identified as a medically underserved area[264] and is predominantly comprised of residents who identify themselves as Black, Hispanic or Latino[265]. Weight management is a proposed outcome measure under option IT-1.20. According to the Health of Houston Survey in 2010, 32% of Houston area adults were obese, compared to 29% across the State of Texas[266] with a high prevalence among non-Hispanic blacks (51% higher) and Hispanics (21% higher)[267]. Obese patients face a higher risk of developing diabetes[268], and weight loss can significantly reduce that risk[269]. Helping patients achieve healthier weights can reduce mortality and morbidity and their attendant costs associated with diabetes as well as, creating an overall healthier population with decreased risk of other medical complications.

Outcome Measure Valuation:

The value of weight reduction was calculated based on the percentage of the population that is obese[18] and not currently diagnosed with diabetes[20]. Of those patients, it is expected that a 5-7% reduction in weight will reduce the risk of diabetes by 58%[21]. The annual savings[21] was applied to the number of diabetes cases avoided due to weight management for the duration of the Waiver.

DRAFT

Title of Outcome Measure (Improvement Target): IT-12.2 Improved Cervical Cancer Screening

Unique RHP outcome identification number(s): 082006001.3.5
Performing Provider Name/TPI: Baylor College of Medicine/082006001

Outcome Measure Description:

Because this is a new clinic, process milestone P-2 was selected in order to establish the baseline to which we can compare outcomes. Outcome IT-12.2 was selected to improve cervical cancer screening rates by 10% over the baseline by DY5.

Process Milestones:

- DY2: P-1
- DY3: P-2

Outcome Improvement Target(s):

- DY4 and DY5: IT-12.2 Increase cervical cancer screening showing improvement year over year

Rationale:

The clinic's goals include ensuring access to timely preventative care. Improvement in cervical cancer screening was selected from this outcome domain in order to measure the clinic's success in achieving this goal. It is complimentary to the other outcome measures as an additional screening and preventative measure ensuring that the health and well being of this target population is maintained.

Improvements in cervical cancer screening can reduce the incidence of cervical cancer by as much as 93%, while also decreasing associated mortality and lowering treatment costs[270]. Black and Hispanic women have much higher rates of incidence and mortality when compared to the general population,[271] of which is a large percentage of this target population[272].

Outcome Measure Valuation:

The value of cervical screening was based on the differential costs of treating localized lesions and cancers and treating regional and distant cancers[273]. The initial, interim and pro rata final stage costs are calculated based on the current incidence of cancer rates in Texas[274] and the reduction of invasive rates when screening occurs every two years

Bayshore Medical Center

Pass 1

DRAFT

Title of Outcome Measure (Improvement Target): Category 3: Quality Improvements:
Outcome Domain 8: Perinatal Outcomes
Improvement Target 8.2: Percentage of Low Birth Weight births

Performing Provider Name/TPI: HCA Bayshore Medical Center/020817501
Unique RHP outcome identification number(s): 020817501.3.1

Outcome Measure Description:

Bayshore will reduce the number of infants born to mothers seen at its three local OB/Gyn clinics with low birth weight, defined as infants weighing less than 2500 grams at birth. Bayshore will achieve this outcome by providing earlier and more consistent care to expectant mothers, and increased education about maintaining a health pregnancy, which will improve the health outcomes of these pregnancies (both for the infants and the mothers). Healthily maintained pregnancies are more likely to produce full-term babies, and also to produce developmentally on-target infants, both of which should cause higher, healthier birth weights than may have otherwise resulted.

Process Milestones:

HCA chose its DY 2-3 process milestones in order to establish a baseline rate of low birth weights for infants born to mothers treated at Bayshore's clinics (by which to measure progress going forward), and to develop a plan for making sure that the expanded OB/Gyn capacity translates into improved health for newborns, including a healthy birth weight.

Rationale:

HCA selected this outcome because low birth weight is associated with myriad of immediate and long-term health problems, including feeding issues, inhibited growth, cognitive and developmental delays, and chronic diseases later in life. Harris County newborns suffer from a higher rate of low-birth weight than the statewide average, making this an important outcome for Bayshore's community. Factors related to the expectant mother that can result in low-birth weight include smoking, drinking alcohol, diabetes, heart disease, poor nutrition, and stress. Increased access to OB/Gyn services will allow mothers at risk for infants with low-birth weight to receive the education, support, and skills necessary to address these factors before or during pregnancy, thereby reducing the likelihood of giving birth to a child under 2500 gram in weight. Additionally, the cost of treating newborns with low birth weight is hard to measure, as it can lead to so many other health problems in the near and distant future. Needless to say, the systemic cost savings associated with preventing low birth weight would have a meaningful

DRAFT

impact on the delivery system and allow for reinvestment of funds into much-needed primary and preventative care.

Outcome Improvement Targets for each year:

During DY2, HCA will determine the percentage rate of improvement it will target in DYs 4-5. Upon determining the baseline and creating a plan for improving patient education, awareness, and health during pregnancy, Bayshore will determine in DY3 reasonable, yet impactful, percentages of improvement to target.

Outcome Measure Valuation:

The valuation of each HCA Bayshore Category 3 outcome takes into account the degree to which the project accomplishes the triple-aims of the Waiver, addresses community needs, benefits the population served by the project, and the investment required to implement the project. The value of this outcome incorporates the potential health benefits for infants born at a healthy weight, the increased satisfaction for the mothers and families of the healthy infants, and the immediate and long-term cost savings associated with providing health care to these infants as they mature.

DRAFT

Title of Outcome Measure (Improvement Target):
Outcome Domain 11: Addressing Health Disparities in Minority Populations
Improvement Target 11.1: Improvement in Clinical Indicator in Identified Disparity Group

Unique RHP outcome identification number(s): 020817501.3.2

Performing Provider/TPI: Bayshore Medical Center/20817501.
Outcome Measure Description:

HCA chose this outcome because one expected outcome of the implementation of tele-psychiatry services at Bayshore and other HCA hospitals in the area is an improvement in the clinical indicators for BH/SA patients. Reduced wait times in the ED for treatment and/or referral to the appropriate care setting is the clinical indicator that Bayshore will measure, as this aspect of the patient's experience in the health care system is tied to improved patient outcomes and satisfaction with the healthcare deliver system.

Process Milestones:

Bayshore chose its DY2 milestone in order to establish the average wait times experienced by BH/SA patients (as a primary or secondary diagnosis) in the EDs at the hospitals participating in the tele-psychiatry program. Bayshore will use this number as a baseline by which to measure improvement going forward.

Outcome Improvement Target(s) for each year:

During DYs 3-5, Bayshore will measure the ED wait time for treatment or referral/transfer, and measure those times against the baseline, looking for improvement in this vital clinical indicator for BH/SA patients. Bayshore will set the actual percentages for the improvement rate targeted in DY3, after establishing a baseline in DY2 and assessing a reasonable, yet impactful, target.

Rationale:

Bayshore selected this project for several reasons. First, most of Houston is comprised of federally-designated Health Provider Shortage Areas (including Harris County Hospital District, and many geographical areas within and around Houston) in the domain of mental health. The shortage of providers results in a disparity in the access to primary, preventative, and specialty care for residents requiring BH/SA health care. As a result of this issue, many patients present at East Houston, West Houston, or Woman's Hospital for BH/SA treatment, and languish in the ED for hours or even days because they simply do not have the capabilities to properly assess their conditions, provide treatment, or refer these patients to the appropriate setting. At Bayshore, there are limited provider resources to treat these patients (being the only hospital in this network with psychiatric beds), meaning that the patients also spend more time than they should in the ED, which takes beds from emergent patients. Finally, this ED crowding and lack of adequate BH/SA provider resources results in more inpatient hospital admissions than would otherwise

DRAFT

occur. The average cost on a BH inpatient stay at Bayshore is $3,723.00. Inpatient stays have a negative impact on patient short-term health outcomes, and reduce patient satisfaction and quality of life. For each of these reasons, Bayshore will use ED wait time for BH/SA treatment or referral/transfer as a clinical indicator of improvement for this group identified as traditionally underserved by the healthcare system.

Outcome Measure Valuation:

The valuation of each HCA Bayshore Category 3 outcome takes into account the degree to which the project accomplishes the triple-aims of the Waiver, addresses community needs, benefits the population served by the project, and the investment required to implement the project. The value of this outcome lies in the potential for improvement to BH/SA patient outcomes and satisfaction, as well as addressing the rampant overcrowding of area EDs (which is expensive, unhealthy, and unpleasant for all involved).

City of Houston Department of Health and Human Services

Pass 1

DRAFT

Title of Outcome Measure (Improvement Target): IT 7.1- Dental Sealant: Percentage of children age 6-9 with a dental sealant on a permanent first molar tooth (Healthy People 2020; CMS Oral Health Initiative goal

Unique RHP Outcome identification number(s): 0937740-08.3.1

Outcome Measure Description:
IT-7.1 Dental Sealant:
- o Percentage of children age 6-9 with a dental sealant on a permanent first molar tooth (Healthy People 2020; CMS Oral Health Initiative goal

Process Milestones:
- o DY 2
  - o Establish Baseline Rates
- o DY3:
  - o P-4: Milestone: Conduct Plan Do Study Act cycle to continually improve program
  - o P-5: Milestone: Disseminate lessons learned and best practices

Outcome improvement targets for each year:
- DY 4:
  - o IT-7.1 Dental Sealant: Increase by 5% over baseline, Percentage of children age 6-9 with a dental sealant on a permanent first molar tooth (Healthy People 2020; CMS Oral Health Initiative goal
- DY 5
  - o IT-7.1 Dental Sealant: Increase by 10% over baseline, Percentage of children age 6-9 with a dental sealant on a permanent first molar tooth (Healthy People 2020; CMS Oral Health Initiative goal (Non-standalone measure)

Rationale:

The Outcome Improvement target for this project was chosen because application of dental sealants in underserved elementary school children promotes dental health in the future. By increasing the percentage of children who receive dental sealants, this program will promote and enhance dental health in underserved children and help close disparities in dental health. The process milestones P4 and P5 were chosen for this project based on the need for documentation of baseline and continuous quality improvements in program for sealant application and dental care. The PDSA cycle will inform systematic data driven program improvements. Inadequate access to dental services compounds other health issues. It can result in untreated dental disease that not only affects the mouth, but can also have physical, mental, economic and social consequences. Fortunately, many of the adverse effects associated with poor oral health can be prevented with quality regular dental care, both at home and professionally. Increasing, expanding, and enhancing dental services will improve overall health outcomes. The improvement targets are based on the two single most important indicators for childhood dental health. Children who have regular access to a dental provider are more likely to have received dental services that can prevent or treat early dental disease. Additionally, unserved or underserved perinatal women are a specially vulnerable group not only for their own dental health but also for the dental health of their children. Education on the importance of dental health can help promote better dental health in young children.

DRAFT

Outcome Measure Valuation:

The Outcome measure was valued at 12.29 % of the overall assigned project value for the associated Category 2 project in year 3, 12.29 % in Year 4 and 12.29 % in Year 5. HHDHS utilized the following method to determine the Category 2 project value.

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.

HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. Oral Health Service Expansion received a composite Prioritization score of 7.65 and a Public Health Impact score of 7.

Title of Outcome Measure (Improvement Target): IT-7.2 Cavities: Percentage of children with untreated dental caries (Healthy People 2020)

Unique RHP Outcome identification number(s): 0937740-08.3.2

Outcome Measure Description:

IT-7.2 Cavities: Percentage of children with untreated dental caries (Healthy People 2020)

(Standalone measure)

Process Milestones :

- DY 2
  - Develop and test data systems
- DY3:
  - P-4: Milestone: Conduct Plan Do Study Act cycle to continually improve program
  - P-5: Milestone: Disseminate lessons learned and best practices

Outcome improvement targets for each year:

- DY 4:
  - IT-7.2 Cavities: Reduce by 2% over baseline Percentage of children with untreated dental caries (Healthy People 2020) (Standalone measure)
- DY 5
  - IT-7.2 Cavities: Reduce by 5% over baseline Percentage of children with untreated dental caries (Healthy People 2020) (Standalone measure)

Rationale:

The process milestones P4 and P5 were chosen for this project based on the need for documentation of baseline and continuous quality improvements in program for reduction of dental caries. The PDSA cycle will inform systematic data driven program improvements. Inadequate access to dental services compounds other health issues. It can result in untreated dental disease that not only affects the mouth, but can also have physical, mental, economic and social consequences. Fortunately, many of the adverse effects associated with poor oral health can be prevented with quality regular dental care, both at home and professionally. Increasing, expanding, and enhancing dental services will improve overall health outcomes. The improvement targets are based on the two single most important indicators for childhood dental

health. Children who have regular access to a dental provider are more likely to have received dental services that can prevent or treat early dental disease. Additionally, unserved or underserved perinatal women are a specially vulnerable group not only for their own dental health but also for the dental health of their children. Education on the importance of dental health can help promote better dental health in young children.

Outcome Measure Valuation:

The Outcome measure was valued at 12.29 % of the overall assigned project value for the associated Category 2 project in year 3, 12.29 % in Year 4 and 12.29 % in Year 5. HHDHS utilized the following method to determine the Category 2 project value.

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.

HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. Oral Health Service Expansion received a composite Prioritization score of 7.65 and a Public Health Impact score of 7.

Title of Outcome Measure (Improvement Target):IT-9.4 Other Outcome Improvement Target (ED appropriate utilization)

Unique RHP Outcome identification number(s): 0937740-08.3.3

Outcome Measure Description:
IT-9.4Other Improvement Target (ED appropriate utilization of non-life threatening, mild or moderately ill 911 callers). This program provides care coordination, by more accurately assessing the 9-1-1 caller's needs via telehealth services and provide the patient more appropriate care in a more appropriate setting than the emergency center. The performing provider and its partners expect to see a reduction in ER usage among non-emergent 911 callers by using telecommunications technologies and connectivity to provide access to underserved non-emergent populations that called 911 through improved access to specialists, improved care and satisfaction and reduced emergency room usage.

Process Milestones:
- DY2:
  - [P-3]: Develop and test Data systems
- DY 3
  - P-4 : Conduct and Update Plan-Do-Study-Act for quality improvement
  - P-5 : Disseminate findings, lessons learned and best practices

Outcome Improvement Targets for each year
- DY 4:
  - IT-9.4Other Improvement Target (ED appropriate utilization -Stand-alone measure) - Reduce all ED visits that are non-emergent (including ACSC) that call into the 911 system by 5% over baseline.
- DY 5:
  - IT-9.4Other Improvement Target (ED appropriate utilization Stand-alone measure) - Reduce all ED visits that are non-emergent (including ACSC) that call into the 911 system by 10% over baseline.

Rationale:
Using telecommunications for patient consults to provide medical data, which may include audio, still or live images, between a patient and a health professional for use in rendering a diagnosis and treatment plan is a viable way to make medical care more accessible. The development and installation of high-speed wireless telecommunications networks coupled with large-scale search engines and mobile devices will change healthcare delivery as well as the scope of healthcare services. It will allow for real-time monitoring and interactions with patients without bringing them into a hospital or a specialty care center. This real/near-time monitoring and interacting could enable a healthcare team to address patient problems before they require major interventions, creating a potentially patient-centered approach that could undoubtedly change our expectations of our healthcare system.

Process measures for Project Planning and implementation needs to happen before lessons learned and best practices can be documented. These measures will be conducted in DY 2 and 3 so that outcomes can be measured in DY 4 and 5.

DRAFT

Outcome Measure Valuation:

The Outcome measure was valued at 12.21 % of the overall assigned project value for the associated Category 2 project in year 3, 12.21% Year 4 and 12.21% in Year 5. HHDHS utilized the following method to determine the Category 2 project value.

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.
HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The Care Houston Links Program received a composite Prioritization score of 7.15 and a Public Health Impact score of 7.

DRAFT

Title of Outcome Measure (Improvement Target): IT-9.4 Other Outcome Improvement Target (ED appropriate utilization)

Unique RHP Outcome Identification Number: 0937740-08.3.4

Outcome Measure Description:
IT-9.4 Milestone: Other Outcome Improvement target (ED appropriate utilization (Stand-alone measure)}
In 2010, the overall rate of nonfatal fall injury episodes for which a health-care professional was contacted was 43 per 1000 persons. Persons aged > 75 years had the highest rate (115 per 1000 persons) of falls. The primary goal of this program is to prevent fall related accidents that result in Emergency Room (ER) visits. Since the primary recruitment source is the EMS database for 911 calls, this program is expected to reduce 911 calls in targeted high risk zip codes for falls in the home setting. This initiative will implement an Evidence-based Health Promotion Program that utilizes community health workers to increase health literacy and provide minor structural changes in homes of a targeted population.
Metric 1: Number of 911 Calls for Falls from specific zip code during measurement period
Metric 2: Number of ED visits for falls from specific zip codes during measurement period
Process Milestones:

- DY 2
  - P-3:: Develop and test Data systems
- DY 3
  - P-4: Milestone: Conduct Plan Do Study Act cycle to continually improve program
  - P-5: Milestone: Disseminate lessons learned and best practices

Outcome Improvement Targets for each year:

- DY 4
  - IT-9.4 Milestone: Other Outcome Measure (ED appropriate utilization)
  - Reduce Number of 911 Calls for Falls from specific zip code during measurement period
  - Reduce Number of ED visits for falls from specific zip codes during measurement period
- DY 5
  - IT-9.4 Milestone: Other Outcome Measure (ED appropriate utilization)
  - Reduce Number of 911 Calls for Falls from specific zip code during measurement period
  - Reduce Number of ED visits for falls from specific zip codes during measurement period

Rationale:
The "Other Outcome Measure" for Category 3 was chosen for this project because it aligns with the goals of the project. Fall related injury and ensuing visit to the ER is one of the 20 most expensive conditions in community dwelling elderly. Preventable falls among community

DRAFT

dwelling elderly result in costly morbidity. According to a new CDC study published in the *Morbidity and Mortality Weekly Report (MMWR)*, an estimated 234,000 people ages 15 and older were treated in U.S. emergency departments (ED) in 2008 for injuries that occurred in bathrooms. Four out of 5 of these injuries were caused by falls—which can have especially serious consequences for older adults. Almost one-third (30 percent) of adults aged 65 and above who were injured in bathrooms were diagnosed with fractures. Among adults aged 85 and older, 38 percent were hospitalized as a result of their injuries. Eliminating hazards at home is one of the recommended strategies for fall prevention in older adults. This Fall Prevention intervention will focus on reducing hazards at home for older adults from specific zip codes so that a costly ER visit is averted.

Outcome Measure Valuation:

The Outcome measure was valued at 9.25% of the overall assigned project value for the associated Category 2 project in year 3, 9.25% in Year 4 and 9.25% in Year 5.

Houston Department of Health and Human Services (HDHHS) utilized the following method to determine the Category 2 project value:

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.

HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The Healthy Homes Fall Prevention project received a composite Prioritization score of 5.4 and a Public Health Impact score of 6.

DRAFT

Title of Outcome Measure (Improvement Target): IT-9.4Other Outcome Improvement Target

Unique RHP Outcome identification number(s): 0937740-08.3.5

Outcome Measure Description:

IT-9.4 ED–Other Outcome Improvement Target (EDAppropriate Utilization)

- By providing patient navigation, non-emergent 911 callers and those that were seen by EMS can be redirected to the CareHouston Links Program. This program provides care coordination, by more accurately assessing the non-emergent 911 caller's needs and connecting them to the required services. This will reduce unnecessary repeat calls to 911 and result in savings to the healthcare system.

Process Milestones:

- DY2:
  - P-3: Develop and Test Data System
- DY 3:
  - P-4: Conduct and Update Plan-Do-Study-Act for quality improvement
  - P-5: Disseminate findings, lessons learned and best practices

Outcome Improvement Targets for each year:

- DY 4:
  - IT-9.4Other Outcome Improvement Target (ED appropriate utilization (Stand-alone measure) - Reduce ED visits that are non-emergent (including ACSC)
- DY 5:
  - IT-9.4Other Outcome Improvement Target (ED appropriate utilization (Stand-alone measure**) -** Reduce ED visits that are non emergent (includingACSC)

Rationale:

A version of the proposed CareHouston Links program was previously targeted to the Sunnyside community in Southeast Houstonwhere an HFD-EMS analysis showed that 26% of all 9-1-1 calls were non-emergency related in this low income, underserved community. Since the CareHouston program's implementation in 2006, the HFD EMS unit experienced a 72% decrease in calls in this area allowing them to divert more than $4.6 million in costs associated with the transport of non-emergency callers to the emergency rooms for services. The CareHouston Links program will reduce future emergency room visits by providing navigation services to clients, educating them about the appropriate use of services and linking them with primary and preventive care services. Ineffective navigation of the health care system by patients may lead to poorer outcomes and inefficiencies because of delayed care, failure to receive proper care or treatments, or care being received in more expensive locations (i.e., emergency rooms).

Linking, assessing and referring clients to appropriate services will reduce their need to use emergency services. Each time an ambulance service is dispatched to transport patients; the cost is approximately $1470. During Fiscal Year 2012, the Care Houston program diverted 1,458 clients from using EMS transports to emergency departments for non-emergencies, saving the COH $2,143,260. Each diverted ambulance transport is also associated with a diverted emergency room visit.

DRAFT

The Other Improvement Target for Reducing Inappropriate ER Use, will be used as our Category 3 Outcome measure. According to Agency for Healthcare Research and Quality, visits to the Emergency Department for non emergent care results in increasing health care costs and overcrowding. A report from Health and Human Services Commission on Rider 56, House Bill 1, from August 2012, states "one of the key strategies to reducing non-emergent ED use is to steer clients to more appropriate sources of care. Integral to achieving this goal is ensuring adequate access to prevention and primary care services. The medical home model is a building block to achieving this objective as is promoting the use of urgent care facilities and retail health clinics when clients cannot go to their medical home." (Article II, Health and Human Services Commission, Rider 56, H.B. 1, 82nd Legislature, Regular Session, 2011).

Outcome Measure Valuation:

The Outcome measure was valued at 11.41% of the overall assigned project value for the associated Category 2 project in year 3, 11.41% in Year 4 and 11.41% in Year 5. HHDHS utilized the following method to determine the Category 2 project value.

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.

HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The CareHouston Links Program received a composite Prioritization score of 7.15 and a Public Health Impact score of 7. The following are avenues of cost savings to the health care system that can be facilitated by a program that seeks to reduce ER usage, such as CareHouston Links.

1. Cost savings attributed to using navigators as part of a preventable ED reduction program
2. Cost savings related to connecting patients to medical homes, increase access to primary and specialty care, and increase access to chronic care management
3. CMS reimbursement rate for EMS transports; Cost savings to CMS when alternate transportation is used

4. Cost savings to CMS for ED visit redirected to a clinic

Title of Outcome Measure (Improvement Target): IT-9.4 Other Outcome Improvement Target(ED appropriate utilization)(Stand-alone measure)

Unique RHP Outcome identification number(s):0937740-08.3.6

Outcome Measure Description:
IT-9.4 Other Outcome Improvement Target(ED appropriate utilization)
The performing provider proposes to provide navigation services to targeted HIV patients who are at high risk of disconnect from institutionalized health care is critical to reduce ED and inpatient use for potentially preventable admissions in HIV patients. Providing navigation services to targeted HIV patients who are at high risk of disconnect from institutionalized health care is critical to reduce ED and inpatient use for potentially preventable admissions in HIV patients.
Numerator: Number of HIV patients enrolled in program that used ER in past 6 months
Denominator: Total number of HIV patients enrolled in Service Linkage Program during the same time period
Data Source: Service Linkage Database and follow up data
Process Milestones:
- DY2:
  - P-X1 Development of Outreach and Education Plan
- DY 3:
  - P-4 Metric: Conduct Plan-Do-Study-Act
  - P-5 Milestone: Disseminate findings, lessons learned and best practices

Outcome Improvement Targets for each year:
- DY 4:
  - IT-9.4 Other Outcome Improvement Target(ED appropriate utilization)Reduce rate of ER visits that are non emergent among HIV patients enrolled in Service Linkage program in past 6 months by 3% over baseline
- DY 5:
  - IT-9.4 Other Outcome Improvement Target (ED appropriate utilization) Reduce rate of ER visits that are non emergent among HIV patients enrolled in Service Linkage program in past 6 months by 6% over baseline.

Rationale:
Patient care navigation has been established as a best practice to improve the care of populations at high risk of being disconnected from health care institutions. Tying inpatient and outpatient care can help integrate inpatient and outpatient services and promote accountability for the coordination, cost and quality of care. This service linkage expansion will provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (for example, Limited English Proficient patients, recent immigrants, the uninsured, those with low health literacy, frequent visitors to the ED, and others).

Outcome Measure Valuation:
The Outcome measure was valued at 10.71% of the overall assigned project value for the associated Category 2 project in year 3, 10.71% in Year 4 and 10.71% in Year 5. HHDHS utilized the following method to determine the Category 2 project value.

DRAFT

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.
Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.
HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The HIV Service Linkage Expansion received a composite Prioritization score of 6.5 and a Public Health Impact score of 6.

DRAFT

<u>Title of Outcome Measure (Improvement Target):</u> IT-4.10 Other Outcome Improvement Target: Average length of stay for patients diagnosed with TB.

<u>Unique RHP Outcome identification number(s):</u> 0937740-08.3.7

<u>Outcome Measure Description:</u>
Outcome Improvement Target 1 [IT-4.10] Other Outcome Improvement Target: Average length of stay for patients diagnosed with TB.
Numerator: Total number of inpatient days for patients diagnosed with TB
Denominator: Total number of patients diagnosed with TB contacted by TB Program

Process Milestones:

- DY2:
  - P-1 Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans
- DY 3:
  - P-4 Metric: Conduct Plan-Do-Study-Act
  - P-5 Milestone: Disseminate findings, lessons learned and best practices

Outcome Improvement Targets for each year:

- DY 4:
  - IT-4.10 Other Outcome Improvement Target: Reduce Average length of stay for patients diagnosed with TB by 2% over Baseline

- DY 5:
  - IT-4.10 Other Outcome Improvement Target: Average length of stay for patients diagnosed with TB by 5% over Baseline

<u>Rationale:</u>
We chose the outcome improvement target IT-4.10 Other Outcome Improvement Target: Average length of stay for patients diagnosed with TB. The comprehensive testing package to ensure early diagnosis, accurate diagnosis and reduction in number of days of treatment will help us achieve our goals. By providing tests that conduct rapid and accurate identification, short duration of therapy and connecting patients to primary care, where they can receive appropriate care decreases the likelihood of length of stay in the hospital. The performing provider (Houston TB Bureau) will utilize the CDC guidelines to accurately and rapidly identify and rule out TB disease for this project. Based on guidelines from Texas Department of State Health Services Tuberculosis Branch standing delegation orders, the Houston TB Bureau will implement the use of 3HP in the treatment latent tuberculosis patients in order to increase patient compliance and completion of LTBI therapy and decrease the number of patient at risk for progression to active TB disease. Studies have shown about 5 to 10 percent of those with latent TB infection in the United States will develop TB disease if not treated. People with latent TB infection who have weakened immune systems, including those with HIV/AIDS or diabetes, are more likely to develop TB disease after infection. For those reasons, treatment is important (3). These potential future TB cases could be admitted to hospitals for diagnoses and treatment.

DRAFT

CDC recommends a minimum of two week hospital stay for patients who are infectious with a positive bacteriology smear results. This project plans to reduce the number of hospital days during admissions for treatment of tuberculosis every year and preventing future TB cases. These efforts will provide cost savings to the health care system.

Outcome Measure Valuation:

The Outcome measure was valued at 11.67% of the overall assigned project value for the associated Category 2 project in year 3, 11.67% in Year 4 and 11.67% in Year 5. HHDHS utilized the following method to determine the Category 2 project value.

HDHHS utilized two categories to calculate value for each DSRIP project. The first category is Prioritization and the second is Public Health Impact (see attachment for HDHHS Valuation Tool). HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Prioritization category. The Prioritization category includes the following factors: 1) Transformational Impact, 2) Population Served / Project Size, 3) Alignment with Community Needs 4)Cost Avoidance 5) Partnership Collaboration and 6)Sustainability. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Prioritization category.

Public Health includes activities which seek to achieve the highest level of health for the greatest number of people. Public Health also focuses on preventing problems from happening or re-occurring through programs and activities that promote and protect the health of the entire community. As a public health department, HDHHS added an additional valuation category of Public Health Impact that looked at projects through a public health lens. The Public Health Impact category includes the following factors: 1) Alleviate Health Disparity, 2) Control Communicable and Chronic Disease , 3) Prevention Orientation, 4) Population Health Focus, 5) Access and Connection to Health Services and 6) Evidence Based Health Program. HDHHS scored the project on a scale of 1 (poor) to 9 (exceptional) for each of the six factors that comprise the Public Health Impact category. Each factor was then given a weighted score based on the score rated and a pre-determined percentage weight. The six weighted scores were added to get a composite score for the Public Health Impact category.

HDHHS gave the Prioritization score a weight of 25% and the Public Health Impact score a weight of 75% to determine the overall project value for the plan. The TB Rapid Identification, Treatment and Recovery Project received a composite Prioritization score of 7.15 and a Public Health Impact score of 7.

DRAFT

Title of Outcome Measure (Improvement Target):IT-1.10 Diabetes care: *HbA1c poor control (>9.0%)*

Unique RHP Outcome Identification Number: 0937740-08.3.8

Outcome Measure Description:
IT-1.10 Diabetes care: *HbA1c poor control (>9.0%)*

Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Approximately 20.8 million Americans have diabetes, and half these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes accounts for nearly 20 percent of all deaths in people over 25 years of age. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars.
Numerator: Percentage of patients 18-75 years of age with diabetes (Type 1 or Type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.
Denominator: Percentage of patients 18-75 years of age with diabetes (Type 1 or Type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.

Process Milestones:

- DY 2
  - P-X1: Milestone: Conduct Community Education and Outreach
- DY 3
  - P-4: Milestone: Conduct Plan Do Study Act cycle to continually improve
  - P-5: Milestone: Disseminate lessons learned and best practices

Outcome Improvement Target(s) for each year:

- DY 4:
  - IT-1.10 Diabetes care: Decrease HbA1c poor control by 2% over baseline in DAWN enrollees (>9.0%)17- NQF 0059 (Stand-alone measure)
    - a Numerator: Percentage of patients 18-75 years of age with diabetes (Type 1 or Type 2) who hadhemoglobin A1c (HbA1c) control > 9.0%.
    - b Denominator: Members 18 to 75 years of age as of December 31 of the measurement year withdiabetes (Type 1 and Type 2)
  - c Data Source: DAWN Case Management Registry
- DY 5:
  - IT-1.10 Diabetes care: Decrease HbA1c poor controlby 5% over baseline in DAWN enrollees (>9.0%)17- NQF 0059 (Stand-alone measure)
    - a Numerator: Percentage of patients 18-75 years of age with diabetes (Type 1 or Type 2) who hadhemoglobin A1c (HbA1c) control > 9.0%.
    - b Denominator: Members 18 to 75 years of age as of December 31 of the measurement year withdiabetes (Type 1 and Type 2)
  - c Data Source: DAWN Case Management Registry
